HUNG-SIU-TS'UEN, hūng'sē-ū'chwēn, or HUNG-HSIU-CHUAN (1812-64). A Hakka schoolmaster who originated and was the leader of the Taiping Rebellion (1850-64). He was born in a small village, about 30 miles from the city of Canton, in 1812, attended school from 7 to 16, became village schoolmaster, continued his own studies and passed all the examinations preliminary to that for the first degree, but failed again and again in the competition for the degree. He was subject to frequent illnesses and in one attack, in 1837, is said to have lain in a trance for nearly 40 days, during which he had a religious vision which profoundly impressed him. A few years later a friend found in Hung's bookcase some Christian books and tracts which Hung had obtained in Canton in 1833. The two began to study them, and Hung found in them the key to his visions and was thereby inspired to destroy idols. They became converted, baptized each other, and began to preach. Hung set out for Kwangsi to convert the aborigines there, but lack of acquaintance with their language made the work difficult. He met others, however, who gladly accepted his teaching and themselves became zealous propagandists. About this time he joined a society of "God worshipers," which had been formed in 1836, and soon became supreme in it. In 1845 he returned to his own province, made many converts, and in 1846 visited a Protestant missionary in Canton and studied the Scriptures with him for two months, but was refused baptism, because the request was accompanied with an application for a monthly stipend. He returned to Kwangsi, and his disciples mostly persons disaffected to the reigning dynasty, began to destroy temples and to demolish idols. In July, 1850, Hung and his followers, who were now numerous, broke out into open rebellion. The civil war which followed was more of a revolt against the Manchu monarchy than a religious crusade. At first Hung had styled himself the "Brother of Christ", he now became the "Heavenly King" (T'ien Wang) and adopted the style of "Heavenly Kingdom of Great Peace" (Taiping Kwoh) as that of the empire he was about to establish. He made Nanking his headquarters until 1864, writing Christian books, issuing edicts to his followers, attending to the printing and circulation of the Bible and other works, and directing the movements of his numerous generals and their immense armies.

The great Taiping Rebellion for a while swept all before it. At one time Europe and the United States seriously considered recognizing the rebels, but the lawlessness and excesses of the latter ruined their cause. Finally, the American Ward, and later the English Gordon with his "Ever Victorious Army," succeeded in winning back the lost ground for the monarchy. June 30, 1864, realizing the coming collapse of

the rebellion, Hung poisoned himself. His body was later found and burned. Consult Meadows, *The Chinese and their rebellions* (London, 1856), Brine, *The Taiping Rebellion* (ib., 1862), Lin-Li, *T'ing Tien-K'ueh History of the T'ing Revolution* (2 vols., ib., 1866), W. F. Mayer, *Chinese Readers' Manual* (Shanghai, 1874), Samuel Mossman, *The Great Taiping Rebellion* (London, n. d.). See CHINA.

HUNG-WU, hung'woó'. The name given to the period of years (1368-98) during which Chu Yuan-chang, the founder of the Chinese dynasty of Ming (1368-1644), reigned, and commonly transferred by Europeans to the Emperor himself. He was a native of the Province of Anhui and was born in 1328, the second son of a poor laborer. At 17 Chu entered a monastery as a novice, but in the troubles of the times this was burned down by rebels under the command of a maternal uncle of his, whose forces he joined. He was given a small command and scored victory after victory. In 1355, on the death of his uncle, he was offered the post of assistant generalissimo. Declining this offer, he recovered from the Mongols, then the ruling dynasty, the whole left bank of the Yang-tse and proclaimed himself Prince of Wu. Within two years he had become master of Kiangsi and part of Chekiang, sent his generals north in 1367, in 1368 mounted the throne as Hung-wu, called his dynasty the Ming, or "Illustrious," and made his capital at the city which has since been known as Nanking, "the southern capital." In the same year he recovered the provinces of Fukien, the two Kwang, and Shansi, and brought Shensi under his sway in 1369. In the following year the last Mongol Emperor died, the dynasty founded by Kublai Khan came to an inglorious end, and China was once more free from the yoke of aliens. In 1371 Szechwan and Liaotung fell before him, and Yunnan in 1381.

Hung-wu proved an able administrator, although the success of his government is attributed largely to the excellent counsels of his wife, and became a liberal patron of education and of literature. He organized the present system of literary examinations, established a new penal code, abolished mutilation as a punishment, regulated taxes and placed the coinage on a proper basis, made Buddhism and Taoism state religions, and prohibited eunuchs from holding office. He also reestablished the customs of the T'ang dynasty (618-907), restored the literati to high offices of state, from which they had been excluded since the time of Kublai Khan, and labored for the welfare of his people. He had 24 sons, all of whom became princes, and set nine of them as governors over as many provinces. He died in 1398 and is known in history as Tai-tsu, his temple name. He is popularly known, however, as the "Beggar King," in allusion to his early poverty. See J. P. A. Rémusat, *Nouveaux mélanges asiatiques* (2 vols., Paris, 1829).

HUNKERS (perhaps from Dutch *honk*, station, home). In American political history, the name applied for some years after 1843 to that part of the Democratic party in the State of New York which stood for conservatism and was arrayed against the radical faction of the same party, known as the Barnburners (qv). Factional differences had arisen in the party prior to 1843, but open and avowed antagonism may be said to date from that year. The Hunkers adhered to the regular Democratic

party in the presidential contest of 1848, while their opponents united with the Free Soilers and with them nominated Van Buren. After 1852 the two factions acted more or less in harmony in both State and national politics. Among the leaders of the Hunkers were Horatio Seymour, William L. Marcy, Samuel Beardsley, Edwin Croswell, and Daniel S. Dickinson. The name Hunkers was also applied at times to the conservative element of the Democratic party in other States.

HUNNERIC, or **HUNERIC**. King of the Vandals in Africa (?-484). He was the son of Genseric, whom he succeeded in 477. In 435 he had been sent to Italy as a hostage for his father's fidelity. One of his wives was a daughter of Theodoric, King of the Visigoths. Suspecting her of a plot against him, Genseric had her nose and ears cut off and sent her home. Another and later wife was Eudocia, the daughter of the Roman Emperor Valentinian III. See VANDALS.

HUNOLD, hoo'nólt, CHRISTIAN FRIEDRICH (1680-1721). A German author, known by his pseudonym Menantes. He was born at Wandersleben and studied law at Jena. Means to carry on his studies failed him, however, and in 1700 he went to Hamburg, then the literary centre of Germany. Here the success of his novel, *Die verliebte und galante Welt* (2 vols., 1700), put an end to his precarious teaching and writing. This was quickly followed by *Der europäischen Hofe Liebes- und Heldengeschichte* (1704) and by *Satirischer Roman* (1705 and 1732), which told so plainly the scandal of Hamburg—which Hunold knew only too well—that he was forced to leave the city (1708). He went to Thuringia, published *Die allerneueste Art ein reinen und galanten Poesie zu gelangen* (1706), besides textbooks in rhetoric and style, and after many wanderings settled in Halle, where he became an instructor in literature, poetry, and jurisprudence, and where his works lost the earlier freedom and obscenity. Consult Wedel, *Geheime Nachrichten und Briefe von Herrn Menantes Leben und Schriften* (Cologne, 1731), and Vogel, *Christian Friedrich Hunold* (Leipzig, 1898).

HUNS (Lat. *Hunni*, *Chunni*, Gk. *Oúvvoi*, *Oúvnoi*, *Χούvροι*, *Chounnoi*, probably from Chin *Hiong-nu*, name of a powerful Tartar tribe). The name of a nation of antiquity which made repeated incursions upon the Roman dominions, and under Attila (qv), the most renowned of its leaders, brought the empires of both the East and the West to the verge of destruction.

The Huns are generally considered to have been a collection of tribes of Turko-Tatar affinities, descendants perhaps of the Hiong-Nu, who figure in Chinese annals as making incursions and founding states in Central Asia as early as the second century B. C. Some authorities think that the bulk of Attila's hordes were of Turke stock, and Theophanes in the eighth century writes of "the Huns whom we commonly call Turks." The distinction between "white" and "black" Huns, made by the mediæval writers, led Bloch (1901) to put forward the view that we have here a dark race in process of transformation into a white one, but the uncertainty of the connotation of these epithets makes such a startling view even less probable. Like the modern Magyars, Osmanlı Turks, etc., the ancient Huns no doubt assimilated themselves to the populations of their environment, and in Europe lost more and more of the distinctly

Asiatic character. The "white" Huns were probably not a little mixed with Asiatic Aryan blood (Iranian, etc.) before they entered upon their career in Europe. About 200 B.C. the Huns overran the Chinese Empire, defeated the Chinese armies in numerous engagements, and drove the Emperor Kao-ti himself to a capitulation and a treaty. During the reign of Wu-ti (141-87 B.C.) the power of the Huns was much broken. Eventually they separated into two distinct camps, one of which, amounting to about 50,000 families, went southward, while the other endeavored to maintain itself in its original seat, but finally the most warlike went west and northwest in search of new homes. Of those that went northwest a large number established themselves for a while on the banks of the Volga. They then, under a leader named Balamir, or Balamber, advanced into the territories of the Alani (qv), a powerful people dwelling between the Volga and the Don. At what period this took place is uncertain, but probably it was early in the fourth century. The Alani resisted the incursions of the Huns until at length a battle was fought on the banks of the Don, in which the King of the Alani was slain and his army utterly routed, the vast majority of the survivors joined the invaders.

The Huns now invaded the country of the Ostrogoths, whose aged King, Hermannrich, roused himself to meet the invaders, but in vain. His successor, Withimn, encountered the Huns in a pitched battle, in which he was himself slain and his countrymen utterly routed. The Ostrogoths now threw themselves upon the protection of the Emperor Valens, who in 376 A.D. gave permission to a great number of them to cross the Danube and settle in the countries on the south side of the river as auxiliaries to the Roman arms against further invasion. The Huns now occupied all the territories that had been abandoned by the Goths, and when the latter not long afterward revolted against Valens, the Huns also crossed the Danube and joined their arms to those of the Goths in hostilities against the Empire of the East. In the wars that followed the Huns were not so conspicuous as the Goths, their former enemies, and but little is known of them during the remainder of the fourth century. It is supposed, however, that early in the following century they were joined by fresh hordes. In the reign of Theodosius the Younger they had increased so considerably in power that to their sovereign Rugilas, or Roas, was paid an annual tribute of about \$70,000 to secure the Empire of the East from further injury.

Rugilas, dying in the year 434, was succeeded in the sovereignty of the Huns by his nephews Attila and Bleda. The latter was put to death by his brother about 444. Attila (qv) carried his arms as far west as Gaul, where the Romans and the Visigoths successfully encountered him in the Catalaunan Plain. In the following year he ravaged Italy, and Rome itself was saved, it is said, only through the awe which its Bishop, Leo I., inspired in the barbarian conqueror. With Attila's death, about 454, the power of the Huns was broken. A few feeble sovereigns succeeded him, but there was strife now everywhere among the nations that had submitted to Attila, and the Huns never regained their power. Many of them took service in the armies of the Romans, and others joined fresh hordes of invaders from the north and the east,

aiding them in their repeated attacks upon the Empire. Consult J. B. Bury, *History of the Later Roman Empire* (2 vols., New York, 1889); Thomas Hodgkin, *Italy and her Invaders* (8 vols., Oxford, 1892); Parker, *A Thousand Years of the Tartars* (1905). See GOTHIS.

HUNT, ARTHUR SURRIDGE (1871-). An English paleographer, born in Romford, Essex. He was educated at Queen's College, Oxford, of which he became fellow, and was demy of Magdalen in 1896-1900 and fellow of Lincoln in 1901-06. In 1895 he began his important research in Egypt which resulted in the discovery of many important Greek papyri. These he edited mostly with B. P. Grenfell (qv). Hunt received honorary degrees from the universities of Königsberg, Graz, Athens, Dublin, and Glasgow, and was made professor of papyrology at Oxford.

HUNT, CHARLES WALLACE (1841-1911). An American engineer, born at Candor, Tioga Co., N. Y. In 1864 he was a special agent of the United States War Department to care for the freedmen. Later he engaged in engineering and manufacturing and became vice president of the Richmond County (N. Y.) Savings Bank. He served as president of the American Society of Mechanical Engineers in 1893 and of the United Engineering Society in 1909 and was a member of other engineering and scientific societies.

HUNT, GAILLARD (1862-). An American writer on history and government, son of W. H. Hunt (1824-84) and brother of W. H. Hunt (1857-). Born at New Orleans, La., and educated at the Emerson Institute, Washington, he represented the State Department at the World's Fair, Chicago (1893), served as chief of the Bureau of Citizenship (1900-09), and was chief of the division of manuscripts in the Library of Congress after 1909. In 1913 he lectured at Johns Hopkins University. Besides editing *Fragment of Revolutionary History* (1892), *The Writings of James Madison* (8 vols., 1900-10), and *The Journals of the Continental Congress*, vols. xvi-xviii (1909), he is author of *History of the Seal of the United States* (1892, 2d ed., 1909), *The Department of State of the United States Its History and its Functions* (1892, 2d ed., rev., 1914), *The American Passport* (1898), *Life of James Madison* (1902), *Disunion Sentiment in Congress in 1794* (1905), *John C. Calhoun* (1908), *Life in America One Hundred Years Ago* (1914).

HUNT, HELEN. See JACKSON, HELEN (FISKE HUNT).

HUNT, HENRY (1773-1835). An English politician, born at Widdington Farm, Wiltshire, and educated by tutors and in private schools. Though educated for the ministry, he turned to farming, which he followed intermittently until within a few years of his death. He was imprisoned in 1800 for challenging to a duel the commanding officer of the Marlborough Troop, in 1810 for an assault upon a gamekeeper, and again in 1819 for two years for his part in the Peterloo massacre. In politics he was a Radical, and allied himself with Sir Francis Burdett, Horne Tooke, William Cobbett, and others of the same party, though he later published a pamphlet in which Burdett was charged with wavering loyalty to the reform, and was alienated from Cobbett through his own overzealousness and political mistakes. He was often a candidate for Parliament and contested many elections. In 1830, through the retirement of

the successful candidate, he obtained a seat from Preston and advocated strenuously women's rights, universal suffrage, and the repeal of the 'On-Laws. He managed to exercise considerable influence upon local politics, and his public speeches, though positive and demagogic, were always impressive, but his disagreeable personality found him few followers in Parliament, and in 1833, having failed of reelection, he retired to private life. Consult *Memoirs of Henry Hunt, written by himself in His Majesty's Jail* (London, 1820).

HUNT, HENRY JACKSON (1819-89). An American soldier, born in Detroit, Mich. His father, Samuel W. Hunt, was an army officer, and after his death the son was appointed to West Point, where he graduated in 1839. He was immediately assigned to the artillery arm of the service. His first active service was on the Canadian frontier in 1839, during the disturbances arising from the Canadian Rebellion, after which he continued in garrison duty until the Mexican War. He served with the Second Artillery in Scott's advance from Vera Cruz to the city of Mexico, distinguishing himself particularly at Contreras and Churubusco, and being twice wounded at the battle of Molino del Rey (Sept 8, 1847). He was brevetted captain and major for his services. He afterward served on the frontier for some years and in 1856 was appointed a member of the board to revise the system of light-artillery tactics. He was promoted captain in 1852, and at the outbreak of the Civil War was stationed at Fort Pickens, Fla., from April to June, 1861. Promoted major in May of that year, he commanded the artillery on the extreme left at the battle of Bull Run. He was in command of artillery in the defenses of Washington in the summer of 1861, and in the September following was promoted colonel, attached to General McClellan's staff, and assigned to organize and command the artillery reserve of the Army of the Potomac. He served throughout the Peninsular campaign, his disposition of the artillery at the battle of Malvern Hill (July 1, 1862) being especially praiseworthy, and in September became chief of artillery of the Army of the Potomac, a position which he held until the end of the war. He participated in the battle of South Mountain on Sept 14, 1862, and on the following day was appointed brigadier general of United States volunteers. He served thereafter at Antietam, at Fredericksburg, where his artillery fire rendered possible the crossing of the Rappahannock, at Chancellorsville, and at Gettysburg, where the withering fire from his batteries rendered impossible the success of Pickett's brilliant charge and turned the tide of battle in favor of the Federal arms. After serving in the Wilderness campaign with distinction he continued on Grant's staff until the close of hostilities, receiving the brevet ranks of major general of volunteers and brigadier general in the United States army. In the winter of 1865-66 he was in command of the military district of Arkansas. In 1866 he was made colonel in the reorganized army, placed in command of the Fifth Artillery, and appointed president of the permanent Artillery Board. He commanded the Department of the South from 1880 to 1883, when he retired and became governor of the National Soldiers' Home at Washington. He published *Instruction for Field Artillery* (1860) and three articles on the battle of Gettysburg in the *Century* (New

York, 1886), later republished in *Battles and Leaders of the Civil War* (1b, 1887).

HUNT, (WILLIAM) HOLMAN (1827-1910). An English religious painter, born in London. He was intended for commercial life, and worked in an office in London for four years, devoting his leisure to reading, drawing, and painting. In his seventeenth year he gave up business and hired a studio, which he paid for with difficulty by painting family portraits and making copies and restorations. In 1844, on his third attempt, he was admitted as a probationer to the schools of the Royal Academy, and in 1845 became a regular student. In 1846 he exhibited at the Academy "Hark," a picture of his little sister holding a watch to her ear. Together with Rossetti and Millais, Hunt founded the Pre-Raphaelite Brotherhood (qv). His first painting that was an exponent of its principles was "The Flight of Madeline and Porphyro," a subject taken from Keats's *Eve of St Agnes*. The most constant follower of Pre-Raphaelitism, he remained unaffected by later art movements. He devoted himself principally to religious subjects, for which he was peculiarly adapted, and became one of the greatest modern exponents of Christianity. His works are full of strong religious feeling and are characterized by an absolute fidelity to nature, to the extent of a hard realism. Every detail, even the leaves and blades of grass, is painted with the utmost minuteness. His works are the triumph of industry. He went to Palestine to study the figures and landscapes of his religious subjects, spending four years there in preparation for his picture "Finding of Christ in the Temple." His industry was richly rewarded by the public, which bought the latter picture for £5000 and "The Shadow of Death" for £10,000. In 1905 he received the Order of Merit, and on his death in 1910 was buried in St Paul's Cathedral with national honors.

The best known of Hunt's works is his "Light of the World," now in Keble College, Oxford (a life-size version is in St Paul's Cathedral, London). It represents Christ, the crown of thorns on His brow and a lantern in His hand, standing before a closed door, it is executed with great detail and realism. Among Hunt's earlier works are a "Converted Christian Family Sheltering Christian Missionaries from the Druids," in the Taylor Museum, Oxford, "Rienzi Vowing to Avenge his Brother's Death," the "Hiring Shepherd," and the "Awakened Conscience." The "Scapegoat" is a strange religious production, representing a goat perishing among the miasmas of the Dead Sea. In the Gallery of Birmingham is the "Finding of Christ in the Temple," at Manchester, the "Shadow of Death," also called "Christ, the Carpenter," and "Valentine and Silvia"; at Liverpool, the "Triumph of the Innocents." Among his latest works were "Isabella and the Pot of Basil," "May Morning in Magdalen Tower," "Holy Fire in the Church of the Sepulchre of Jerusalem." Consult G C Williamson, *Holman Hunt* (New York, 1902), W H Hunt, *Pre-Raphaelitism and the Pre-Raphaelite Brotherhood* (2 vols, 1b, 1906), M E Coleridge, *Holman Hunt* (1b, 1908), T L Hare, *Leaders of English Pre-Raphaelites* (1b 1909).

HUNT, ISAAC (1751-1809). An English lawyer and Loyalist in the American Revolutionary era, father of Leigh Hunt the poet. He was born in Barbados, West Indies, was sent to school

in Philadelphia and studied law there, but the college declined to grant him an M.A. degree on account of his anonymous literary productions, which were highly displeasing to the popular sentiment of the time. When the Revolution was actually in progress, he was mobbed and imprisoned for his activity in the royal cause, but fled to England where he entered the Church. After preaching in London for a time he became a private tutor and wrote *The Political Family, or a Discourse Pointing out the Reciprocal Advantages which Flow from an Uninterrupted Union between Great Britain and her American Colonies* (1775), and *Right of Englishmen, an Antidote to the Poison of Thomas Paine* (1791).

HUNT, JOHN (1812-48) An English Wesleyan clergyman and missionary, born at Balderton, Nottinghamshire. For nearly three years he studied at the Wesleyan Theological Institution at Hoxton. In 1838 he went as a missionary to the cannibals of the Fiji Islands and labored among them until his death, achieving marvelous results. He was the author of the following volumes, all published posthumously: *Entire Sanctification Its Nature, the Way of Attainment and Motives for its Pursuit* (1853), *Memoir of Rev W. Cross, Missionary to the Friendly and Feejee Islands* (1848, 2d ed., 1858), *Wesley and Wesleyanism* (London, 1868). Consult G. S. Rowe, *The Life of John Hunt, Missionary to the Cannibals* (London and New York, 1859), and Joseph Nettleton, *John Hunt, Pioneer Missionary and Saint* (London, n.d.).

HUNT, (JAMES HENRY) LEIGH (1784-1859) An English poet and essayist, born at Southgate, Middlesex, Oct. 19, 1784. He was a son of Isaac Hunt (q.v.). His mother was of Quaker descent. The boy was educated at Christ's Hospital, London. While at school he wrote verse in imitation of Collins, Gray, and others. A selection of these juvenile poems his father helped him to publish in 1801, under the title *Juvenalia*. In 1805 Leigh attracted some notice by his theatrical and literary criticism in the *News*, a short-lived paper started by his elder brother, John. Two years later he made out of these contributions a book entitled *Critical Essays on Performers of the London Theatres*. He also served as clerk in the office of his brother Stephen, who was an attorney, and for a short time he occupied a minor post in the War Office. In 1808 he joined with his brother John in founding a newspaper called the *Examiner*, of which he was editor for 13 years. In this paper, in 1816, he presented Keats and Shelley to the public. Hunt was a Liberal in politics before Liberalism had become fashionable; and for one of his articles, reflecting on the obesity of the Prince Regent—"a fat Adams of fifty," Hunt had called him—he was sentenced to pay a fine of £500 and to undergo two years' imprisonment. Hunt was happy enough in his confinement, he hid the prison bars with flowers and received visits from Byron, Shelley, and Keats. Released in 1815, he published the next year *The Story of Rimini*, a verse narrative based on Dante's episode of Paolo and Francesca.

In 1818 appeared a volume of original poems and translations entitled *Foliage*. The next year he started another journal, the *Indicator* (continued for 76 weeks), in which first appeared some of his best essays. In 1821, having severed his London literary connections, he went to

Italy to assume the editorship of a journal projected by Byron and Shelley. There were annoying delays, Shelley died, Byron and Hunt quarreled, and of this journal, called the *Liberal*, only four numbers appeared (1822-23). Returning to London, Hunt gave his version of the enterprise in *Lord Byron and Some of his Contemporaries* (1828). In the same year he began the *Companion* (28 numbers), a sequel to the *Indicator*. In 1834 he started the *Leigh Hunt's Journal*, which he edited for about two years. His principal works, besides those already mentioned, are *Captain Suord and Captain Pen* (1835), a poem, *Legend of Florence* (1840), a fine play, *The Seer* (1840), a selection from his essays in various magazines, some remarkable prefaces to an edition of the Restoration dramatists (1840), *Palfrey, A Love Story of Old Times* (1842), *One Hundred Romances of Real Life* (1843), made up from contributions to his *Journal* in 1834-35, *Imagination or Fancy*, containing the well-known essay on *What Is Poetry?* (1844), a volume of his collected poems (1844), *Wit and Humour*, selections from the English poets, with comments (1846), *Stories from the Italian Poets, with Lives* (1846), *Men, Women, and Books*, a delightful collection of miscellanies (1847), *A Jar of Honey from Mount Hybla* (1848), made up mostly of contributions to *Amusements Magazine* in 1844, the *Autobiography* (1850, enlarged, 1860), *Table Talk* (1851), *The Old Court Suburb* (1855). In spite of his industry, Hunt was always poor. In 1844 Sir Percy Shelley settled upon him a pension of £120, which was augmented in 1847 by a government pension of £200. He died at Putney, Aug. 28, 1859.

Hunt undoubtedly wrote too much, but the best of his poems and essays render his reputation secure. *The Story of Rimini* is one of the finest narrative poems since Dryden, his *Palfrey* is delightful from its good spirits and bright, sunny glimpses of landscape and character, and *Abou-ben-Adhem* is a charming fable. As an essayist he is always cheerful and fanciful, and as a critic he is subtle and appreciative. His style is graceful.

Bibliography. *Autobiography*, ed. by his son, T. Hunt (London, 1860), *Poetical Works* (ib., 1860) and *Correspondence* (ib., 1862). Miller, *Leigh Hunt's Relations with Byron, Shelley, and Keats* (New York, 1910). C. T. Winchester, *A Group of English Essayists* (ib., 1910).

HUNT, RUD (1870-) An American pharmacologist, born at Martinsville, Ohio. He was educated at Johns Hopkins University (A.B., 1891; Ph.D., 1896), at the University of Bonn, and at the College of Physicians and Surgeons, Baltimore (M.D., 1896). He taught physiology at the College of Physicians and Surgeons (Columbia) in 1896-98, was associate and associate professor of pharmacology at Johns Hopkins from 1898 to 1903, served as chief of

division and professor of pharmacology in the United States Public Health Service from 1904 to 1913, and thereafter was professor of pharmacology in Harvard Medical School. He is author of *Studies in Experimental Alcoholism* (1907); *Studies on the Thyroid* (1909), with Atherton Seidell, *Effects of Various Diets upon Resistance of Animals to Poisons* (1910), *Effects of Derivatives of Choline and Analogous Compounds on the Blood Pressure* (1911), with R. de M. Taveau. He also contributed to Heffter's *Handbuch der Experimental-Pharmakologie* (1914).

HUNT, RICHARD MORRIS (1828-95). An American architect, born at Brattleboro, Vt., the brother of William Morris Hunt. At 15 he began the study of architecture in Geneva, Switzerland, and five years later entered the Ecole des Beaux-Arts in Paris, the first of American students there. After travel in Europe, Asia, and Egypt, he was employed as inspector of works on the Louvre, and, under his old master Lefuel, who had succeeded Visconti, he had charge of the details of the Pavillon de la Bibliotheque. In 1855 he returned to his own country, worked under Walter on the Capitol extension at Washington, and later established in New York the earliest American atelier, or studio, of architecture, which became a nursery of great architects and the pioneer of all American training schools of architecture. He was the designer of the Lenox Library, the Tribune Building, New York, the United States Naval Observatory at Washington, the Divinity Building at Yale, the Administration Building for the World's Fair, Chicago, the Yorktown Monument, the earlier buildings of Hampton Institute (Virginia), the pedestal of the statue of Liberty in New York harbor, and the Fogg Museum of Harvard University. Among private houses by him are those of H. G. Marquand, W. K. Vanderbilt, New York, the country house of George Vanderbilt, Baltimore, N. C., and several beautiful summer houses at Newport, R. I., including Mrs. O. H. P. Belmont's "Marble House," and "The Breakers." Mr. Hunt exercised a powerful influence on the architecture of America—less, perhaps, by the intrinsic merit of his designs, though they were often of a high order, than by the inspiring force of his personality. He was one of the founders and in 1888 became president of the Institute of Architects. He was Chevalier of the Legion of Honor and a foreign associate of the Institute of France. In 1898 the associated architectural and art societies of New York City erected a beautiful memorial to him, including a bust, inserted in the Central Park wall, it faces Fifth Avenue at Seventieth Street. Consult "Richard Morris Hunt. His Art and Work," in *Architecture and Building*, 1895 (New York, 1895).

HUNT, ROBERT WOOLSTON (1838-) An American metallurgical engineer, born in Fallsington, Bucks Co., Pa., and educated at Covington, Ky. He worked in a rolling mill at Pottsville, Pa., studied chemistry at Philadelphia (1859-60), and served as superintendent of steel and iron works at Wyandotte, Mich., at Troy, N. Y., and elsewhere until 1888, when he became head of Robert W. Hunt & Co., consulting engineers and inspectors of steel. He was president of the American Institute of Mining Engineers (1883 and 1906), of the American Society of Mechanical Engineers (1891), and of the Western Society of Engineers (1893).

HUNT, THOMAS STERRY (1826-92). An

American scientist born at Norwich, Conn. He studied chemistry and acted as laboratory assistant at Yale College. In 1847 he was made chemist and mineralogist to the Geological Survey of Canada and, while holding this position, was also for several years professor of chemistry at Laval and McGill universities. In 1872 he resigned his position on the Geological Survey to become professor of geology at Massachusetts Institute of Technology, and six years later he retired from official service. His extensive and fruitful researches in general and economic geology, in pure and applied chemistry, and in mineralogy, won for him a place of eminence in the scientific world, and universities and learned societies the world over conferred upon him their honors. He was made a fellow of the Royal Society of London, Chevalier of the Legion of Honor in France, and an honorary doctor of laws of the University of Cambridge, and served as president of the American Association for the Advancement of Science (1870), the American Institute of Mining Engineers (1876), the American Chemical Society (1879 and 1888), and the Royal Society of Canada (1884). Besides a very large number of papers on special scientific topics, his publications include the following works: *Chemical and Geological Essays* (1874), *Azoic Rocks* (1878), *The Domain of Physiology* (2d ed., 1882), *Mineral Physiology and Physiography* (1886), *A New Basis for Chemistry* (1887), *Systematic Mineralogy* (1891).

HUNT, WARD (1810-80). An American jurist, born in Utica, N. Y. He was educated at Union College, prepared himself for his legal career in Litchfield, Conn., and after following his profession for many years in his native town, of which he was mayor in 1844, he was raised to the Court of Appeals in New York (1865) and seven years later to the bench of the United States Supreme Court. This position he occupied for 10 years and then retired with a pension.

HUNT, WILLIAM (1842-) An English clergyman and historian. He was educated at Harrow and at Trinity College, Oxford, was vicar of Congresbury, Somerset, in 1867-82, and then went to London as a reviewer and contributor to the *Dictionary of National Biography*. He was president of the Royal Historical Society in 1905-09 and wrote *The English Church in the Middle Ages* (1888), *The English Church, 597-1066* (1899), the first volume in a series of which he was editor, the tenth volume of the *Political History of England* (1905-07), of which he was joint editor with R. Lane-Poole. *The Irish Parliament of 1775* (1907), edited from a contemporary manuscript.

HUNT, WILLIAM HENRY (1790-1864). An English water-color painter of still life, genre, and landscapes. He was born in London the son of a tin-plate worker, and was a cripple from childhood, but he early became the apprentice pupil of John Varley (qv) and one of the proteges of Dr. Thomas Munro, of Adelphi Terrace. In 1807 he exhibited at the Royal Academy and the next year, on the advice of William Mulready, entered the schools of the Academy. His early work was largely in oil, but after 1824, when he became an associate of the Water-Color Society (member, 1826), he devoted himself almost exclusively to water colors and between 1824 and 1831 exhibited 153 drawings, of which 8 were candlelight scenes, and 60 were figures of fisher folk at Hastings. From

1831 to 1851 he exhibited on an average 25 drawings a year. At his death, in 1864, he left a fortune of £20,000. After 1826 still life, flowers, fruit, vegetables, game, and poultry, began to predominate in his drawings over figures and landscapes. Because of his lameness he painted many of his landscapes from the windows of his house at Hastings, where he spent part of each year for 30 years. Though a man of little general culture, he had a strong vein of humor, as illustrated by drawings that chromolithography has popularized, such as "Massa Sambo," "Too Hot," "The Card Players," "The Young Shaver," "The Attack," and "The Defeat." In the Tate Gallery there are five of his drawings, in the Victoria and Albert Museum, 36. Important private collections were made by Louis Huth and James O'Rook. While Hunt's subjects are simple, his treatment of them is unexcelled, and technically he possessed all the resources of water color. Ruskin said of him: "He was, take him for all in all, the finest painter of still life that ever existed." Consult Ruskin, *Notes on Samuel Prout and William Hunt* (London, 1879), Richard and Samuel Redgrave, *Century of Painters of the English School* (2d ed., 1b, 1890), J. L. Roget, *History of the Old Water Color Society* (2 vols., 1b, 1891).

HUNT, WILLIAM HENRY (1824-84) An American lawyer and public official, born in Charleston, S. C. After studying for two years at Yale College in the class of 1843, he removed to Louisiana, studied law, and was admitted to the bar in 1844. During the next 30 years he lived in New Orleans, practicing law and serving as professor in a law school. Throughout the Civil War he favored the Union cause and even afterward remained a staunch Republican. In 1876 he was appointed Attorney-General of Louisiana to fill a vacancy and was regularly nominated for that position in the same year, but the vote was contested and largely through the agency of President Hayes the Democratic candidates were placed in office. Hunt was made a judge of the United States Court of Claims in 1878, was prominently mentioned two years later as a successor to Justice Strong on the Supreme Court bench, and in 1881 was appointed by Garfield Secretary of the Navy, after he had declined the judgeship of the United States Circuit Court of the Fifth District. He retired when Arthur reorganized Garfield's cabinet and in 1882 was made Minister to Russia.

HUNT, WILLIAM HENRY (1857-) An American judge, son of the preceding and brother of Gaillard Hunt. He was born in New Orleans, La., and was educated at Yale University. He served as collector of customs for Montana and Idaho (1881-85) and in Montana as Attorney-General (1885-87), member of the Legislature (1889), district judge of the First Judicial District (1889-94), and justice of the Supreme Court (1894-1900). For a year after this he was Secretary of Porto Rico, and from 1901 to 1904 he was Governor. He returned to the bench as United States district judge for the District of Montana, in 1910-11 was associate judge of the United States Court of Customs Appeal, and from 1911 to 1914 served as associate judge of the United States Commerce Court.

HUNT, WILLIAM MORRIS (1824-79) An American landscape, figure, and portrait painter. He was born at Brattleboro, Vt., March 31, 1824,

the son of a member of Congress and brother of the architect R. M. Hunt. He entered Harvard College in 1840, but, compelled to leave on account of his health, he traveled in Europe. He studied sculpture for a short time at Rome with H. K. Brown and in Paris under Barye, but in 1846 took up painting at the Academy of Düsseldorf. Dissatisfied with the methods there, he worked five years as the favorite pupil of Couture in Paris. Attracted to Barbizon, he became a friend and follower of Millet, who exercised the strongest influence on his art. In 1855 Hunt returned to the United States and soon afterward established himself in Boston. There he became a very successful teacher of painting and exercised a marked influence upon American art. He taught his pupils the new art methods of Paris and influenced large classes, not only by the superiority of his aims, but by his own work. His criticisms and sayings in his studio were compiled and edited by his pupil Helen M. Knowlton and published under the title *Talks on Art* (3 vols., Boston, 1875-82). Under sudden derangement he committed suicide at the Isles of Shoals, Sept. 8, 1879. His work is fine in color and masterly in execution. At first he showed a preference for figure subjects—peasants, children, flower girls, and Parisian types. In portrait painting his aim was to represent the character of the person, even at the expense of finish in the accessories. His later subjects were principally landscapes, in which he showed largeness of style and vigor of execution.

Among his most important figure subjects are "Head of a Jewess," "Sheep Shearing at Barbizon," "The Farmers' Return," "The Fortune Teller," "The Prodigal Son." The Boston Museum contains a number of his works: "Girl with the Kitten," "Girl Reading," "Peasant Girl at Barbizon," "Marguerite," "Hurdy-Gurdy Boy," and a portrait of the artist. In the Metropolitan Museum of Art are seven examples, including an excellent "Landscape" in the Barbizon style, "Girl at a Fountain," and "The Bathers." His portraits include those of Chief Justice Shaw (Court House, Salem), one of the best portraits painted in America, Mrs. F. G. Ward, Mrs. Charles Francis Adams, Mrs. G. W. Long, William H. Gardner, and William M. Evarts. Among his landscapes are "Gloucester Harbor," "Newton Lower Falls," "Coast Scene at Magnolia, Mass.," and "Dead in the Snow." His most ambitious works, the "Flight of Night" and "Discovery," colossal decorations in the Capitol at Albany, were executed in 1878, not long before his death. They were hopelessly damaged by the cracking of the stone on which they were directly painted, and were concealed by later additions to the ceiling, but the sketches show them of lofty conception and magnificent movement. Two of these studies are in the Metropolitan Museum, New York. Consult Hinton, in *American Art Review* (New York, 1880), H. M. Knowlton, *The Art Life of William Morris Hunt* (Boston, 1899), Samuel Isham, *History of American Painting* (New York, 1903), Hunt, in *Masters in Art* (Boston, 1908).

HUNTER, DAVID (1802-86) An American soldier, born in Washington, D. C. He graduated at West Point in 1822 and from 1833 to 1836 served as captain of dragoons in the Far West. He held the rank of major throughout the Mexican War, entered the Civil War as colonel of the Sixth Cavalry, and headed the

Second Division of the Army of the Potomac at the first battle of Bull Run, where he was severely wounded. He was afterward promoted to be a major general of volunteers (1861), commanded the Western Department and the Department of Kansas, was then appointed head of the Southern Department, and was the first to enlist colored troops. He gave a premature order in 1862 for the manumission of slaves in Georgia, Florida, and South Carolina, which President Lincoln countermanded, but the Confederate Congress outlawed the author. In 1864 Hunter was head of the Department of West Virginia and led 18,000 men to an unsuccessful attack upon Lynchburg, leaving the valley of Virginia exposed by his retreat. General Grant defended his reputation when it was attacked. Hunter presided at the court which tried the conspirators in the assassination of Lincoln. At the close of the war he was brevetted brigadier and major general in the regular army. He was retired from active service July 31, 1866.

HUNTER, EDWARD (1839-). An American soldier, born at Gardiner, Me. He graduated at West Point in 1865, was commissioned in the army as second lieutenant of the Twelfth Infantry, U S A. In 1867-69 he was aid-de-camp to General Getty at Santa Fe, N Mex., and participated in the battle of Dec 25, 1868, against the Apachoe and Cheyenne Indians. Transferred to the First Cavalry, U S A., in 1870, until 1886 he served in California, Nevada, Washington, and Montana, and in 1879 was promoted to be captain. In 1888 he became major and judge advocate and as such served in the Division of the Pacific and the Department of California from 1889 to 1895. He was made lieutenant colonel in 1895 and served as deputy judge advocate in the Department of Dakota until 1898 and in that year went with General Brooke to Porto Rico as judge advocate. Later he was judge advocate of the Department of the East. He retired in 1903.

HUNTER, GEORGE LELAND (1867-). An American authority on decorative art. He was born at Bellingham, Mass., and was educated at Phillips Exeter Academy and at Harvard University (A.B., 1889). After teaching privately for a decade in Chicago he removed to New York, devoting his attention to the decorative arts, particularly to textiles and furniture. The fruits of his wide studies in European and American collections, both public and private, were published in many magazine articles and in several books. His *Tapestries, their Origin, History, and Renaissance* (1912) is the best book in English on the subject. He published also *Home Furnishing* (1913) and *The House that Jack Built* (1914), organized important loan exhibitions of tapestries in connection with lecture promenades, in museums and elsewhere, and had charge of the department of decorative arts in the second edition of the *NEW INTERNATIONAL ENCYCLOPEDIA*.

HUNTER, GORDON (1863-). A Canadian jurist. He was born at Beamsville, Ontario, and was educated at the Brantford Collegiate Institute and at Toronto University where he graduated in 1885. He studied law and was called to the Ontario bar in 1888, but went to British Columbia and was called to the bar of that province in 1892. He was first official law reporter to the British Columbia Supreme Court, but resigned in 1894 and engaged successfully in the practice of his profession.

In 1902 he was appointed Chief Justice of British Columbia. In the following year he also became a royal commissioner for the purpose of investigating strikes and lockouts between mine owners and their employees throughout British Columbia. In 1908 he was administrator of the Provincial government.

HUNTER, HERNE THE See **HERNE THE HUNTER**

HUNTER, JOHN (1728-93). A celebrated English physiologist and surgeon, born at Long Calderwood, Glasgow, Scotland, the youngest of 10 children. After a deficient primary education he was apprenticed to a cabinetmaker, but in 1748 he began to make up deficiencies in his education and applied himself to anatomy under his brother's tuition. During this period he demonstrated the manner of the descent of the testis to the scrotum in foetal life, studied the placental circulation, traced the distribution of the olfactory nerve in the nose, and, with his brother William, elucidated the function of the lymphatic system. He studied under Cheselden at Chelsea Hospital and under Pott between 1749 and 1753 and at Oxford from 1753 to 1754, became a hospital pupil in surgery in 1754, and was made house surgeon at St George's Hospital in 1756. He joined the army as staff surgeon, serving in France and Portugal from 1761 to 1763, practiced surgery in London from 1763, was made a fellow of the Royal Society in 1767, became surgeon to St George's Hospital in 1768, surgeon extraordinary to the King in 1776, and deputy surgeon-general to the army in 1786. He received the Copley medal from the Royal Society in 1787. Hunter was an indefatigable student of comparative anatomy, physiology, and botany. At his house at Earl's Court, from 1772 until his death, he kept and studied creatures from all quarters of the globe. Fishes, birds, lizards, hedgehogs, silkworms, leopards, hornets, and wasps are mentioned among the objects of his study and observation. He lodged shot in the leg bones of young pigs at definite distances and then fed them with madder, which stains living and growing tissues, and demonstrated the manner in which bones grow. He first discovered the principle of compensatory development of blood vessels under the "stimulus of necessity." He tied the common carotid artery of a buck and noted that cutting off its main blood supply did not materially interfere with its growth and development. Dissection of the animal later showed that small branches above and below the place of tying had enlarged sufficiently to meet the physiological demand. This discovery emboldened him to ligate the great arterial trunks in cases of aneurism, relying on the establishment of collateral circulation to prevent death of the limb. His first operation on this theory was a ligation of the femoral artery, for aneurism, in the fibrous sheath (still known as Hunter's canal) where it passes through the muscles of the thigh. He is said to have dissected over 500 different species of animals, many of them repeatedly. Hunter died in his sixty-fifth year, of a spasmodic heart attack brought on by a somewhat acrimonious discussion at a board meeting, over the admission of pupils to St George's Hospital. He was of a warm temperament and was subject in his later years to such attacks. He was a man of great industry, the boldest and best operative surgeon of his day as well as the greatest anatomist known and a marvelous zoologist. His museum

contained at the time of his death 10,563 specimens and preparations illustrative of human and comparative anatomy, physiology, pathology, and natural history. He died in comparative poverty, and his collection was purchased, two years after his death, by the government for £15,000 and was presented to the Royal College of Surgeons. In addition to numerous papers contributed to the *Transactions* of the Royal and other learned societies, he published the following independent works: *A Treatise on the Natural History of the Human Teeth* (part 1, 1771, part 2, 1778), *A Treatise on the Venereal Disease* (1786), *Observations on Certain Parts of the Animal Economy* (1786), *A Treatise on the Blood, Inflammation, and Gun-shot Wounds* (1794). Consult Palmer, *The Works of John Hunter, FRS, with Notes* (4 vols., London, 1838). To this is prefixed *The Life of John Hunter, FRS*, by Otley.

HUNTER, JOHN DUNN (c1798-1827). An American adventurer from a Southern settlement who claimed that he had been captured and reared by Western Indians. His account of explorations with them and of their manners and customs was ultimately discredited, but it is certain that when he came to New Orleans in 1817 he knew no English, and that he studied it there and in Kentucky. He was lionized while visiting England, but on his return to America did nothing but make trouble among the Mexicans and Indians and was finally killed by one of the latter. The work by which he is known was published in London and Philadelphia and translated into German and Swedish. The English edition is called *Memoirs of a Captivity among the Indians of North America from Childhood to the Age of Nineteen* (1823).

HUNTER, JOSEPH (1783-1861). An English literary antiquary, born at Sheffield. He studied for the Presbyterian ministry, in 1809 was appointed to a congregation in Bath, and in 1833 removed to London, where he became sub-commissioner of the public records and assistant keeper (1838). His researches began in early life and extended over his entire career. He edited various volumes of records, made discoveries in regard to the first settlements in America, and illustrated the text of Shakespeare's plays by investigations in many directions. His voluminous notes are now in the British Museum. Among his publications are *Hallamshire* (1819, enlarged, 1869), *Disquisitions on Shakespeare's Tempest* (1839), *New Illustrations of the Life, Studies, and Writings of Shakespeare* (1845), *Milton* (1850), *Robin Hood* (1852), *The Founders of New Plymouth* (1854), and *The Church and Congregation of Protestant Separatists at Scrooby* (1854).

HUNTER, MRS LEO. See PICKWICK CLUB.

HUNTER, PETER (1746-1805). A Canadian administrator and soldier, born in Scotland. He chose the army as his profession and in 1799 had risen by hard service in the Revolutionary War to the rank of lieutenant general and commander in chief of the forces in British North America. In the same year he was appointed Lieutenant Governor of Upper Canada, succeeding Gen John Graves Simcoe. He remained in office six years. He gave his military duties precedence over the civil, and in the early part of his term intrusted the government to a commission while he was absent in Quebec. On his return he aided the passage through Parliament of measures providing more equal repre-

sentation and improving trade between Upper Canada and the United States. Responsible government was not yet established, and Hunter was charged with trusting too much to the advice of an irresponsible executive, yet he strove to be just and, though occasionally misled, was, on the whole, a fair-minded and successful administrator. He died at Quebec.

HUNTER, ROBERT (?-1734). A British Colonial Governor of New York and Jamaica. He belonged to an Ayreshire family. He served on the Continent, fought at Blenheim, and rose to be a colonel of dragoons before he was made Lieutenant Governor of Virginia in 1707. The vessel in which he had sailed to the Colony was taken by the French, and he was held a prisoner, but soon was exchanged for the Bishop of Quebec. In 1710 he came to America again, this time with a shipload of persecuted German Protestants who had sought an asylum in England, and Colonel Hunter, being now Governor of New York, was able to establish them comfortably along the Hudson, though the settlement was an unending care to himself. Difficulties between royal governors and Colonial assemblies were rife even in his day and he doubtless rejoiced to return to England in 1719, but he was sent out again 10 years afterward to be Governor of Jamaica and major general of the local troops, positions which he filled most creditably until his death.

HUNTER, ROBERT MERCER TALIAFERRO (1809-87). An American politician, born in Essex Co., Va. He graduated at the University of Virginia in 1829 and after studying law at the Winchester (Va.) Law School began practicing in his native county the following year. His political career began in 1833 with his election to the State Legislature, and in 1837 he took his seat in the national House of Representatives, to which he had been elected as a Democrat. From the beginning he attracted attention by his earnest opposition to Clay's protective policy and the United States bank scheme. Re-elected to the next Congress, the Twenty-sixth, he was, although only 30 years old, chosen Speaker of the House. He was re-elected to the Twenty-seventh Congress and was defeated for the Twenty-eighth (1843-45), but was re-elected to the Twenty-ninth and served until his elevation to the United States Senate in 1847. He served as Senator until the outbreak of the Civil War, withdrew after the secession of Virginia, and was expelled in July, 1861. He was a radical States-Rights Democrat and a champion of Texas annexation, the Fugitive Slave Law, and all other legislation favorable to the slave power. As chairman of the Senate Committee on Finance for many years, he was a prominent figure in financial legislation, was the author of the low tariff of 1857, the originator of the bonded warehouse system, and one of the first to advocate civil-service reform. In 1860 he was a prominent candidate for the Democratic nomination for President before the Charleston Convention, receiving, next to Douglas, the highest number of votes. He was a member of the first provisional Confederate Congress, was Secretary of State in the Confederate cabinet for a few months in 1862, and was then chosen from Virginia a Senator in the Confederate Senate, where he served throughout the war, leading the opposition to the Davis administration in that body. In 1865 he was one of the Confederate commissioners with Alex-

ander Stephens and J A Campbell to confer with President Lincoln and Secretary Seward at Hampton Roads (See HAMPTON ROADS CONFERENCE) After the war he was Treasurer of the State of Virginia from 1874 to 1880, and from 1885 until his death collector of the port of Tappahannock, Va., but he took no part in national politics Consult M T Hunter, *A Memoir of Robert M T Hunter* (Washington, 1903), and Anderson, "Robert Mercer Taliaferro Hunter," in the *John P Branch Historical Papers*, of Randolph-Macon College, vol 11, no 2 (Ashland, Va, 1906)

HUNTER, WILLIAM (1718-83) A Scottish anatomist, the elder brother of John Hunter He was born at Long Calderwood, Lanarkshire He took up the study of theology at the University of Glasgow, but decided to devote himself to the study and practice of medicine In 1746 he was invited by a society of naval surgeons to deliver a course of lectures on operative surgery After 1748 he confined himself almost exclusively to obstetrics and became connected with the Middlesex and the British Lying-in hospitals In 1764 he became physician extraordinary to Queen Charlotte and in 1768 was appointed professor of anatomy in the Royal Academy His principal work is an *Anatomical Description of the Human Gravid Uterus and its Contents* (1783)

HUNTER, WILLIAM ALEXANDER (1844-98) A Scottish lawyer and politician He was born at Aberdeen, where he was educated in the grammar school and in the university, graduating from the latter (M A) in 1864 He was called to the English bar at the Middle Temple in 1867 and was professor of Roman law (1869-78) and of jurisprudence (1878-82) at University College, London Thenceforward he devoted himself to politics and from 1885 to 1898 was a Liberal member of Parliament, where he was a persistent advocate of old-age pensions, and where he obtained a measure establishing free elementary education in Scotland He published two well-known texts, *A Systematic and Historical Exposition of Roman Law in the Order of a Code* (1876; 2d ed., 1885) and *Introduction to Roman Law* (1880, 3d ed, 1885)

HUNTER, SIR WILLIAM WILSON (1840-1900) A British Indian administrator, scholar, and statistician, born in Glasgow Educated at Glasgow, Paris, and Bonn, he entered the Indian civil service in 1861 Eight years afterward he was transferred from Orissa and put on special duty to plan an Imperial gazetteer of British India; in 1871 he was appointed director general of statistics Ten years later after the appearance of the first edition of the *Imperial Gazetteer of India* (condensed to 9 vols in 1881), which was edited by Hunter and is one of the greatest works of reference on India, he was made a member of the Governor-General's council and in 1882 acted as president of the educational commission He retired from the service in 1887, settled at Oxford, and became a regular correspondent of the *London Times* on affairs in India. He wrote in a vigorous and picturesque style and for the most part with great scientific accuracy *Annals of Rural Bengal* (1868, 5th ed, 1872), *Comparative Dictionary of the Non-Aryan Languages of India and High Asia* (1868), which has more valuable material than original induction, as Hunter himself saw afterward, a *Statistical Account of Bengal* (1875-77), *Statistical Account of Assam* (1879),

A Brief History of the Indian Peoples (1880, and, in more expanded form, 1895, under the title *The Indian Empire*), *Life of the Earl of Mayo and Life of the Marquis of Dalhousie* (1890), *The Old Missionary* (1895), a story, a biography of his friend Brian Houghton Hodgson (1896), *The Thackerays in India* (1897), and the incomplete but valuable *History of British India* (1899-1900) Consult Skime, *Life of Sir William Wilson Hunter* (London, 1901), and W W Hunter, *The India of the Queen and Other Essays* (New York, 1903)

HUNTER COLLEGE See NORMAL COLLEGE

HUNTER'S MOON The full moon immediately following the harvest moon (q v)

HUNTING (AS *hunting*, from *huntran*, to hunt, connected with Goth *hunþan*, to seize, and probably with Eng *hand*) The pursuit of game, especially as a recreation or sport The true sportsman is a strong supporter of every law designed for the protection of game (see GAME LAWS, WILD LIFE, CONSERVATION OF) and rarely kills game for any other purpose than for eating, unless it is a dangerous creature or a nuisance Thus, an animal like the fox is hunted partly on account of its destructiveness and partly for the enjoyment to be obtained in its pursuit Hunting is a very ancient amusement, and the pursuit of game, either as a pastime or for the necessities of subsistence, has from the earliest times been one of the characteristic occupations of the human race According to tradition, Alexander the Great paid a large sum for a treatise on this subject by Aristotle, and the chase has been described by Appianus, Nemesianus, and many other classic authors

Firearms The improvement in firearms may be said to have simplified hunting to some extent, but, on the other hand, it has caused most of the hunted animals to be more wary and has made more necessary than ever the study of natural history and woodcraft by the hunter It is impossible to prescribe hard and fast rules about the choice of hunting weapons, whether for large or small game, but an inexperienced person may well consult an expert as to the "fit" of the gun he intends to buy, i e, the length of stock, "drop," weight, etc For a more detailed description of the various types of shotgun and rifle for every variety of game, the reader is referred to SHOTGUN, RIFLE, HUNTING

Dogs. A description of the various varieties of dogs used in the hunting or pursuit of game will be found under FIELD DOGS Other closely related articles are GAME PRESERVE, HORSE, HORSEMANSHIP

There are many methods of hunting, and some animals necessitate a pursuit in special ways, but the killing of game by shooting is by far the most common method and the one to which this article is largely devoted In consequence of improved methods of agriculture, shooting of birds over dogs in England and parts of Scotland and Ireland has become practically a thing of the past, and the "drive," or *battue*, wherein the game is driven past the hunter, is the common method In America dogs may be regarded as a necessity in the hunting of most game birds, excepting waterfowl Many rules have developed for the guidance of sportsmen when shooting together in the field, some of the more important of which may be mentioned Where two persons are shooting together, it is the rule

for one not to shoot at a bird which is flying towards his companion. It is very necessary to condemn the firing across a comrade's face, and good-fellowship demands that a bird should never be fired at if it is flying so that it must cross before a companion until he has failed with both barrels of his gun. Where the birds fly directly away from the sportsmen, shots are taken at them alternately unless several should rise at once, when it is permissible for each man to fire at the birds on his own side.

Kinds of Game. *Snipe* first appear in spring and are usually found in meadows and salt marshes. Windy weather, if the wind is not too high, is a favorable time. Among expert gunners the jacksnipe (Wilson's snipe) is a great favorite, owing to its swift and erratic flight. *Woodcock*.—During the day these birds may be found seeking for food in marshy thickets. When flushed, they fly in a rising straight line as far as the top of the bushes, and then, after making some little distance horizontally, they settle down by means of a number of quick zigzag movements. *Grouse*.—The two most important varieties are the ruffed grouse (generally called partridge in the Northern States, though locally known as the pheasant) and the pinnated grouse, or prairie chicken, now nearly extinct. In common with the Canada grouse (spruce partridge) and the blue and sharp-tailed grouse of the West, they have stout bills, short feathered legs, and dark plumage. The partridge is found in thick woods and is greatly protected by its color, which is so much like that of the ground that the bird is frequently overlooked. It is very shy and wild and frequently will run far ahead of the dogs and eventually rise completely out of range. Sometimes they are hunted with dogs and shot after they have taken refuge in a tree, but the keen sportsman never shoots unless he can secure them on the wing. The ruffed grouse is the most cunning game bird to be found in the Northern States. The *Quail* is often called partridge in the Southern States and is popularly known as the bobwhite. There are many species and subspecies of the bird, all of about the same size, though the plumage of the Eastern and Western forms differs greatly. They are found in the Eastern and Middle States but are more abundant in the South and Southwest. They afford good sport and are more easily got at than grouse or woodcock. They are usually hunted with dogs and make a very swift flight. *Wild Fowl* (in which general description are included swans and geese, and among the ducks canvasbacks, black ducks, red-heads, mallards, teal, pintail, and wood duck) abound especially along the New Jersey coast, Delaware and Chesapeake bays, Currituck Sound, the Mississippi valley, Puget Sound, the Willamette and Columbia rivers. They are very fond of wild rice and wild celery and are frequently lured to waters in which they have no natural food by hunters who plant wild rice. They are hunted in a variety of ways, among which may be enumerated the following. The hunter may station himself concealed near a point over which they fly and shoot them as they pass, or he may put out decoys (see *Decoy*), or he may steal upon them while they are feeding or resting. In the Chesapeake Bay particularly, and occasionally elsewhere, sink boats are used, in which the gunners lie and shoot the birds as they fly over. Another method is to sink a box in the

sand or shallow water in which the hunter lies as in a sink boat. Another very successful way is to employ the trained Chesapeake Bay dog, which will run up and down the shore and by its actions excite the curiosity of the birds, which, if they approach to satisfy their curiosity, are within easy range of the gun. This method is known as *tolling*. *Wild Turkeys* are hunted with or without a decoy call or whistle. They are easily tracked by their trail on the ground and may be shot at their roosts if surprised at break of day. The *Rail* is usually hunted from boats at flood tide—a method which demands considerable skill and experience on the part of the man who manipulates the boat. *Hunting the hare* with beagles is a very popular sport in England, partly for the exercise it affords and partly for its economy, in that horses are not required.

Ammunition. For a discussion of rifle ammunition, see the articles *RIFLE*, *HUNTING*, *SMALL ARMS*. In the article *SHOTGUN* the modern tendency to discard large-bore guns for those of smaller bore is noted, and the following suggestions are made with due regard for that tendency. Many sportsmen make the mistake of using too small shot whatever the game they are hunting. This is done under the generally mistaken impression that a thick cloud of small shot is more likely to prove deadly than a thinner cloud of larger shot. It should be borne in mind, however, that small shot has several distinct disadvantages. In the first place, at comparatively short ranges the body of the bird or animal may be struck by from six to a dozen of the smaller pellets, which are likely to interfere seriously with the pleasure of eating the creature, whereas two or three of the larger pellets would have brought down the game, and in at least some instances would have passed clear through the body. Again, small shot necessarily loses its momentum much sooner than a larger size, so that at comparatively long ranges it might fail to inflict wounds which kill or cripple at once, with the result that the game may escape to die of its wounds. Many experienced gunners therefore advocate the use of the largest shot that will make a cloud which at the normal range will be dense enough to make it impossible for the animal to escape being hit at least two or three times, if the gun be held true.

From this point of view the following suggestions are made as to the size of shot to be used for certain game: partridge (grouse), No. 4 or 5, woodcock, No. 7 or 8, quail, No. 6 or 7, rail, No. 6 or 7, snipe, No. 7 or 8, teal and other small ducks, No. 5 or 6, mallard black duck, and others of similar size, No. 2 or 3 (or even No. 1), geese and brant, No. 1 or BB, turkey, BB, squirrel, No. 4 or 5, rabbits, No. 4 or 5, hare, No. 1 or 2, etc. Three and a half diams of smokeless powder to an ounce and an eighth of shot is an adequate normal load for a gun of 12 bore, though this may well be increased slightly if geese, brant, turkey, or other large and hardy birds are the game. The great bulk of the shotgun ammunition now used is "factory loaded," in paper shells which are not reloadable, and the product is usually quite reliable.

HUNTING BIG GAME The term "big game" is an elastic one, but may generally be understood to include all wild mammals larger than the common fox. The establishment of game preserves (see **GAME PRESERVE**) in Africa and America and the enforcing of stringent game laws, especially such as protect female animals at all times, have done much to conserve these species, but even with such protection rigidly enforced, the only large wild mammal not in danger of extermination is the polar bear, whose habitat in the Arctic is unlikely to be invaded by hunters in numbers sufficient to menace its existence.

Africa. The characteristic big game animals

of Africa are the lion, leopard, and cheeta of the cat tribe, the elephant, rhinoceros, and hippopotamus among the pachyderms, the buffalo of the Bovidae, some 30-odd large species of antelope, and the zebras.

There is no unanimous agreement among sportsmen as to what big game (including, for the moment, the tiger) is most dangerous to hunt. As to the African animals, Frederick Courteney Selous, one of the most skillful and successful of contemporary hunters (and an accurate observer as well), places the lion first, the buffalo and the elephant about on a par, and the rhinoceros last. Sir Samuel Baker put the elephant first, followed by the rhinoceros, buffalo, and lion. Many hunters insist that the buffalo is the most determined and vicious of all the mammals, once he has really begun to fight. Col Theodore Roosevelt says "on the whole it seems to me that the weight of opinion among those best fitted to judge is that the lion is the most formidable opponent of the hunter, under ordinary conditions. This is my own view" (*African Game Trails*, p 64). As to the tiger, though there can be no difference of intelligent opinion concerning the animal's great ferocity, courage, and vitality, experienced hunters say that it is rather less likely, than is the lion, to break cover and make a determined charge in plain sight. Colonel Roosevelt and other hunters are agreed, however, that the leopard, though naturally less dangerous than the lion or the tiger because of its smaller size, shows all of the ferocious courage of its larger relatives, and even more extraordinary vitality.

There are various methods of hunting the lion. One is to lie in wait for the beast near one of its fresh, but only partly devoured, kills in the hope that it will return for another meal, or the hunter may attempt to bait the lion by means of a dead animal or a living one tethered, or he may lie in wait at a water hole known to be frequented by lions. All of these are unsatisfactory, since each is likely to involve a long wait, with the probability that the lion will detect danger and make off, also on account of the difficulty of shooting in the dark. The most common method is to hunt for the spoor of the beast and drive him from his hiding place.

Though naturally a nocturnal animal, lions are frequently found on the plains in daylight, usually when returning to their cover in the early morning or starting out, in the late afternoon, for their night hunt. Under these circumstances a lion will generally shuffle away, even if he sees he is being pursued, but when pressed close or angered by shots he is almost certain to come to bay and charge with the utmost determination and ferocity. The hunter must stand his ground and shoot accurately and rapidly as long as the animal shows the slightest sign of being able to advance. This shooting is not likely to be very difficult, since a charging lion usually does not come on at a bound, but at a very rapid gliding pace, with its body quite close to the earth. If the hunter attempts to escape, it is practically certain that the lion will overtake and kill him outright or inflict wounds with its teeth and claws from which violent and usually fatal septic poisoning ensues.

Paul J Ramey (qv), the American sportsman, made a remarkable demonstration in 1911 of the efficiency of trained dogs in lion hunting. He took with him to Africa about 30 tracking

and fighting dogs. There he trained the tracking dogs to follow the trail of a lion until the animal was at bay, when the fighting dogs would come up and worry the beast, keeping out of its reach meanwhile, until the hunters arrived. Tracking and actually stalking the animal in the jungle or other thick cover, and killing it at close quarters, is sometimes accomplished, but this method is regarded as generally little less than foolhardy.

Any modern repeating rifle, using ammunition loaded with high-power smokeless powder and an expansive or soft-nosed bullet, of from about 0.35 to about 0.40 calibre, will be found effective in shooting soft-skinned animals like the lion, leopard, or tiger.

Elephant hunting is considered little, if any, less dangerous than the pursuit of the lion, and even more difficult, because of the necessity generally of following the great beasts into jungle growths. So dense are such growths that the hunter frequently cannot see clearly for 20 feet in any direction excepting along the trail he is following. As the animals' hearing and sense of smell are very acute, it is necessary to approach cautiously upwind, and not infrequently to within 25 or 30 yards, before a fair shot can be obtained. The only shot which is certain to kill the animal outright is one which penetrates the brain, and if the elephant's head is seen from the side—the more favorable position—the mark presented is a space only about seven inches long by three inches wide, lying roughly between the eye and the ear. Any shot not instantly fatal is very likely to provoke a charge by the wounded animal. It is dangerous to attempt a frontal head shot at an African elephant, as the brain cavity is protected to some extent by the tusks, which are set much more deeply into the skull than are those of the Indian elephant, and a heart shot is not likely to stop one of these great beasts when he charges at close quarters. A bullet through the brain from a small calibre rifle will kill an elephant instantly, but because of the difficulty of hitting that organ unless the animal's head is fully exposed, elephant hunters generally use a rifle of comparatively large calibre (0.40 or more), and always a full metal-jacketed bullet, the soft-nosed bullet being ineffective against all of the pachyderms. Many elephant hunters prefer the double-barrel rifle to the repeater, because with it a second shot may be fired much more quickly than with any single-barrel magazine weapon which must be loaded after each shot.

Rhinoceros hunting is usually much less difficult than is elephant hunting, because the animal is likely to be found in the open, and on account of its poor eyesight may generally be approached (unless it is warned by the tick birds) upwind to within easy shooting distance. The rhinoceros is naturally an aggressive and exceedingly truculent animal, and is very likely to charge the hunter most savagely once it discovers him. Despite the beast's great bulk, it gets under full headway—which is no mean pace—with astonishing celerity, and must be hit very hard in a fatal spot before it can be stopped. The animal's brain is so small, and so well protected by the formation of the skull and from the front by its horns, that the hunter usually is obliged to depend upon the fore shoulder or the heart shot.

Apparently all hunters are agreed as to the vicious disposition of the African buffalo and the blind courage and persistence of the animal's charges. The danger of hunting the animal is increased by its great bulk and strength, which enable it to move very rapidly in the dense and deep papyrus swamps which it frequents, and by its thick horns, which often join in great bosses over its forehead, giving protection to its brain. Many hunters have been killed by charging buffalo, and in some districts they become so aggressive that they attack both natives and white men without provocation. Powerful rifles, like those employed in elephant hunting, must be used in the pursuit of the buffalo.

Hippopotamus hunting is comparatively dull sport, as the animals are usually shot through the head while they are floating on the surface of still water. Occasionally an animal will charge the boat bearing the hunters or dive and rise under it, but as a rule the animal is killed with little peril to its pursuers.

Little need be said about the hunting of the various African antelope, most of which are very timid. The larger species, like the roan and the sable when wounded or at bay, will sometimes turn on the hunter and become dangerous because of the skill with which they can use their long and taper-like horns. Even the big and somewhat stupid gnafie must be approached with caution if it is crippled or shows fight, for it is very quick and expert at kicking with both its fore and its hind legs. The hunting of these animals usually involves mere skill in stalking, with the element of danger generally absent.

Asia. The characteristic big game animals of Asia are the tiger, leopard, elephant, rhinoceros, buffalo, several species of bears, and numerous species of goats and deer. A few lions occur in certain districts of Persia, Mesopotamia, and Guzerat. Tiger hunting is the distinctive big-game pursuit of the continent. In India usually one of two methods is employed: either the animal, having been discovered in the jungle is driven to the hunters by native beaters, or is dislodged by a line of elephants specially trained for this purpose and carrying the sportsmen. When native beaters are used the hunters usually occupy platforms built in trees at a safe distance from the ground. The attempt to bait a tiger to within shooting distance by means of a tethered animal is no more likely to be successful than is the same method when employed in hunting lions.

Leopards are commoner than tigers in Asia, but they are even more difficult to hunt, because they are much harder to drive out of their cover.

The Indian elephant is not so large as the African species and is more easily killed, because its tusks do not protect the brain cavity in the manner peculiar to the African animal, and therefore it may be shot from the front as well as from the side. The three species of rhinoceros in Asia are widely distributed, occurring in Assam, Burma, Siam, Sumatra, and Borneo. As the animal is usually found in marshes covered by heavy and tall grass, it is commonly hunted from elephants. More exciting is the hunting of buffalo in the forests of Burma and India. The animal is apparently less aggressive than its African relative, but when wounded it has a trick of lying in wait for the pursuing

hunter and dashing out on him in an attempt to take him unawares. The pursuit of wild goats and sheep which frequent the high mountain ranges requires great exertion and skill in mountain climbing, while the shooting is often done at long range.

America The big-game animals of North America are the bears, the musk ox, many representatives of the deer family, the mountain sheep and goats, the pronghorn antelope (now fast disappearing), the jaguar, the puma or mountain lion, and the lynx of the cat family, and the wolves.

Of the carnivores the bears are the most hunted, excepting the polar bear, which, for reasons already mentioned, is comparatively free from molestation. Polars are usually taken on ice floes or islands to which they resort for their food. When angered by pursuit or when wounded, this bear is quite likely to turn on the hunter, and then becomes a dangerous antagonist.

The Alaskan brown bear group includes the great Kodiak bear, which is by far the largest of the existing carnivores and probably often exceeds a weight of 1200 pounds. These bears live chiefly in the mountain fastnesses and are most frequently seen and shot along the streams to which they resort in the spring to catch salmon. Thus engaged they are likely to become much absorbed, and may sometimes be approached within shooting distance. Powerful rifles (though not necessarily of very large calibre) firing soft-nosed bullets should be used in hunting this huge beast.

There can be no doubt that the grizzly bear's temper has undergone a great change since he first came into contact with civilized man. The early explorers and frontiersmen have left records which show that in their day the grizzly was naturally ferocious and quite disposed to take the aggressive upon slight or no provocation. To-day the animal seems inclined to make off at full speed the instant it suspects the presence of man. It does this so promptly that even in a bear country probably 10 will make a complete and unseen escape where one will be seen. A she bear with cubs is likely to become aggressive if she sees a hunter near by, and any grizzly, if wounded or at bay, is likely to make a stand or even to charge. But even in the latter event two animals may act in a totally different manner, one turning back if shot, or stopping to whine and bite at the wound, while the other may come on with the most determined ferocity, and though badly wounded, may continue to charge until it is killed or succeeds in knocking down the hunter. In the charge one may simply bowl a man over by a single blow and then retreat, another may be satisfied by giving the hunter two or three bites when he is down, and a third may lie on its victim and deliberately bite him to death.

The black bear is a much smaller animal than the grizzly and correspondingly less dangerous, though it could easily overpower and kill a man. It is a comparatively timid beast and seldom shows fight if it can see a way of escape. Unlike the grizzly, which does not climb trees, the black bear is a skillful climber and is apt to adopt that method of escaping from dogs, thereby making it easy prey for the hunter.

The jaguar, which rarely occurs north of Mexico, is not only the largest and most powerful of the cat family in the Western Hemi-

sphere, but ranks next to the tiger in size and strength. It is lacking in the aggressiveness and courage of its Asiatic and African relatives, and when pursued by dogs usually soon takes to a tree, where it is easily shot. The puma or cougar, also called mountain lion, is the most widely known of the cat tribe in North America and is also common in Central and South America. It is an active and handsome animal, but an arrant coward, and like the jaguar promptly takes to a tree when it is chased by dogs.

Of the Cervidæ family in America, the moose is probably the most interesting from the hunter's point of view. It is taken commonly by calling, by still-hunting, or by tracking. In the first-named method the bull is attracted (during the breeding season) by imitating the call of the cow, on a megaphone-like horn, usually made of birch bark. Upon hearing this call the bull usually answers—sometimes from a distance of a mile or more—by a short, deep grunt, and then comes on, as a rule very slowly and quietly, making détours in an endeavor to get the scent of the hunter, for apparently the animal always suspects that he is being deceived. Despite its huge bulk and weight and its widespread antlers, it frequently makes this advance, even through a dense forest, so noiselessly that it may approach to within 40 or 50 yards before its presence is discovered. An old and pugnacious bull will sometimes challenge as he draws near, and if the cow's call is then repeated, the animal may come on at a run, roaring and battering its antlers against the tree trunks, apparently for the purpose of intimidating any other bull which may be in the vicinity. Still-hunting the moose involves stealthy walking and watching in the forests which the moose are known to frequent, while tracking is usually practiced after a fall of snow. The animal is also frequently shot from a canoe, when it comes to a river or lake to drink or feed. The moose seldom turns on a hunter, but a wounded animal should always be approached very cautiously.

Elk hunting offers considerably less variety than the pursuit of the moose and is a less difficult operation, especially during the breeding season, when the bulls frequently betray their whereabouts by their loud and repeated challenging. This animal is protected in nearly all parts of its natural range within the United States. The caribou is a rather dull animal, which usually may be approached upwind quite easily, so that its hunting rarely requires much skill or manoeuvring.

The hunting of mountain sheep probably puts to a severer test the hunter's skill than does the pursuit of any other American game. The animal is apt to be found high up in lofty mountains, and to get within shooting distance is likely to involve much hard and dangerous climbing. The mountain goats are found in the same sort of places and are thought by some hunters to be even more sure-footed than the sheep, but they are much less alert and intelligent.

The methods of hunting the various smaller deer require no special description. All are taken chiefly by still-hunting in the daytime. The white-tailed deer is the most numerous and the most widely distributed, it is very intelligent, always alert, and exceedingly swift of foot, so that still hunting it successfully requires stealth, patience, knowledge of the animal's

habits, and quick and accurate shooting. That the animal is still to be found in practically every State in the United States, despite the fact that it is hunted virtually everywhere during an open season, is sufficient proof of its cleverness in eluding its chief enemy.

For a list of works on hunting big game, see the bibliography appended to HUNTING. See also RIFLE, HUNTING, LASSO.

HUNTING CAT, or **HUNTING LEOPARD** See CHEETA

HUNTING DOG This interesting animal (*Lycaon pictus*), which inhabits all the more open parts of Africa south of the Sahara and Abyssinia, is an aberrant species of dog, distinguished from the typical *Canis* by having four toes on each foot and other structural peculiarities. It is about as tall as a greyhound, its legs being relatively long and slender and adapted to the swift and enduring speed upon which it must depend for a livelihood. The head is broad and flat, with a short muzzle armed with massive teeth, rather large upstanding furry ears, and a suggestion of the hyena in the physiognomy, hence it is sometimes called hyena dog, though the likeness (even to the spotted hyena) is wholly superficial. (See Plate of WOLVES AND WILD DOGS with WOLF.) The fur is short, thick, and smooth, and grows more shaggy about the cheeks and throat, and the tail is long and wolflike. In general color this dog is yellowish gray, but it is marked most irregularly with a variety of colors, such as a combination of red, white, yellow, and black spots, so that the hyena dog may be regarded as the most parti-colored of all mammalia. In the southern Sudan, where the animals are plentiful, Schweinfurth saw one specimen that was perfectly tame, required no other restraint than a cord, and yielded to its master with all the docility of an ordinary dog. This fact appears to corroborate the assertion of Livingstone that the natives of the Kalahari Desert are accustomed to break in this animal and train it for the chase.

To the Africans generally, however, both white and black, the hyena dog was one of the most truly wild and dangerous animals of the country, taking the place of the wolves of the northern part of the world. They gathered into packs and astonished and terrified the early settlers and explorers by their numbers, audacity, and strange cries. They frequented mostly plains and scantily forested or brushy regions, where the small antelopes abound, which were their principal prey, and which they would pursue in concert, often only two working together, until the baffled victim (often of the larger species) was cornered or exhausted and might be pulled down. They were a terrible scourge to the sheep and goats of the early frontier farmers and killed or mangled many more of the flock in one of their nocturnal forays than they could possibly eat. The war waged against them in consequence and the diminution of the wild game have caused a great decrease in their numbers, but numerous bands still range the wilds of East and Central Africa and the deserts west and north of Cape Colony. Consult, for early history of the animal, the books of Livingstone, Gordon-Cumming, Moffat, Harris, and their contemporaries, and for later facts, G. Schweinfurth, *Heart of Africa* (trans. 2 vols., London, 1878), F. C. Selous, *A Hunter's Wanderings in Africa* (1b, 1890, New York, 1911), Richard Lydekker, *The Game Animals of Africa* (Lon-

don, 1908), and especially Roosevelt and Heller, *Life-Histories of African Game Animals* (New York, 1914). See DOG.

HUNTINGDON A municipal borough, capital of Huntingdonshire, England, on the Ouse, 59 miles north of London (Map England, F 4). It is celebrated as the birthplace of Oliver Cromwell, the entry of whose birth is to be seen in the register of St John's Church under the year 1599. The grammar school, founded in 1260, where he and Samuel Pepys were educated, has been restored. The town has a race course at which meetings are held each August. Of Saxon origin, the town was the seat of a royal castle built in 919. Huntingdon received its charter of incorporation in 1189. A fine bridge erected in the thirteenth century connects it with Godmanchester. It is presided over by a mayor, 4 aldermen, and 12 councilors. Pop, 1901, 4261, 1911, 4003.

HUNTINGDON. A borough and the county seat of Huntingdon Co., Pa., on the Juniata River, 98 miles west of Harrisburg, on the Pennsylvania and the Huntingdon and Broad Top Mountain railroads (Map Pennsylvania, F 6). It is the seat of Juniata College (Church of the Brethren), opened in 1876, and of the State Industrial Reformatory, and it contains a hospital. The city is in an agricultural and fruit-growing region, with valuable forests and deposits of iron, coal, fire clay, and limestone, and has manufactures of flour, machinery, radiators, furniture, stationery, woolen goods, lumber, etc. Huntingdon was settled about 1760 on the site of a famous Indian council ground, now marked by a "Standing Stone Monument," erected at the borough centennial. The government is administered under the original charter of incorporation, adopted in 1796, which provides for a chief Burgess, chosen every three years, and a council elected at large. Pop, 1900, 6053, 1910, 6861.

HUNTINGDON, HENRY HASTINGS, third EARL OF (1535-95). An English noble, leader of the Protestant party, son of Francis Hastings, the second Earl, whom he succeeded in 1561. He was an intimate of Edward VI who knighted him in 1548, and, through his mother's descent from George, brother of Edward IV, he claimed after Elizabeth the succession to the crown. Especially in 1562, during her severe illness, he was considered as her probable successor. He hotly opposed the scheme to marry Mary Stuart to Norfolk and was intrusted by Elizabeth to see that the Scottish Queen did not escape at the time of the threatened uprising in 1569. In the same year he was one of the council which considered the evidence against Mary, helped try Norfolk in 1573, and was prominent and active in the preparations of 1588 for the Spanish invasion. Huntingdon was a zealous Puritan in sympathies, possibly for political reasons. He was succeeded by his brother George.

HUNTINGDON, HENRY OF See HENRY OF HUNTINGDON.

HUNTINGDON, SELINA HASTINGS, COUNTESS OF (1707-91). One of the most influential promoters of the early Methodist movement. She was the second of three daughters of Washington Shirley, second Earl Ferrers, and was born at Stanton-Harold, Leicestershire, Aug. 24, 1707. She married, in 1728, Theophilus, ninth Earl of Huntingdon. She adopted the principles of the Methodists, much to the dismay of her friends, and gave her life with increasing zeal,

especially after the death of her husband, in 1746, to the interests of the new sect, introducing its ideas into aristocratic circles, to which its other adherents had no access. She was an intimate friend of both Wesleys, of Whitefield, and of many other clergymen prominent in her time. In the dispute between the Wesleys and Whitefield she sided with the latter and assumed a leadership among the Calvinistic Methodists, who came to be known as "The Countess of Huntingdon's Connection." For the education of ministers she established and maintained a college at Trevecca in Wales (removed, in 1792, to Cheshunt, Hertfordshire, and in 1905 to Cambridge), and built or became possessed of, over 60 chapels in different parts of the country, the principal one being at Bath. She likewise expended large sums in the support of young men trained to itinerant preaching as well as in private charity. She died in London, June 17, 1791. By her will she created a trust bequeathing her chapels to four persons for their care and management after her death. Consult *Selina, Countess of Huntingdon*, by a member of the houses of Shirley and Hastings (2 vols., London, 1839-40), A. H. New, *The Coronet and the Cross, or, Memorials of Selina, Countess of Huntingdon* (ib., 1857), Abel Stevens, *Women of Methodism* (New York, 1866), Sarah Tytler (pseud.), *Countess of Huntingdon and her Circle* (ib., 1907).

HUNTINGDONSHIRE. An east-midland county of England, bounded on the east by Cambridgeshire, on the south by Bedfordshire, and on the west and north by Northamptonshire. Area, 365 square miles, almost the whole of which is in arable or pasture lands (Map England, F 4). Pop., 1901, 54,125, 1911, 55,577. It is watered chiefly by the Ouse, the Nene, which skirts its northern boundary, and the Kym. The northern portion of Huntingdonshire is included in the great fen country called Bedford Levels. The soil is various, clay, however, predominates generally. Grain, beans, peas, mangold, cabbage, rape, and clover are the chief crops. Its dairy products are well known, bee farming is engaged in, and cattle are raised. There are manufactures of paper, parchment, brick, and tile. Capital, Huntingdon. Consult W. M. Noble, *Huntingdonshire* (New York, 1911), with maps, diagrams, and illustrations.

Huntingdonshire was traversed by two Roman roads, and Roman remains, as coins, pottery, etc., have been found. In early Anglo-Saxon times it belonged to East Anglia, afterward to Mercia.

HUNTING LEOPARD. See CHEETA.

HUNTINGTON. A city and the county seat of Huntington Co., Ind., on Little River, 24 miles southwest of Fort Wayne, on the Wabash, the Cincinnati, Bluffton, and Chicago, and the Erie railroads (Map Indiana, G 3). It has a United Brethren college, a business college, county hospital, courthouse (costing \$350,000), fine city hall, and a public library, which contains a fine collection of Indian relics. There are railroad shops of the Chicago and Erie, numerous limekilns and woodworking establishments, and manufactures of boots and shoes, pianos, gloves, railroad cranes, clamshell buckets, cedar chests, furnaces, etc. The city has no trolleys and is one of the first cities in the world to operate an extensive system of automobile transit cars. Settled in 1834, Huntington was incorporated as a town in 1848 and in 1873 was chartered as a city. Under a statute of

1905 the government is vested in a mayor, elected quadrennially, and a city council. The water works and electric-light plant are owned and operated by the municipality. Pop., 1900, 9,491, 1910, 10,272, 1914 (U. S. est.), 10,479. Huntington was the scene of important activities in connection with the Knights of the Golden Circle (q.v.).

HUNTINGTON. A town, including several villages in Suffolk Co., N. Y., on Long Island Sound, 35 miles east by north of New York City, on the Long Island Railroad. It is in a fertile agricultural district and is primarily a residential suburb of New York and a popular summer resort. There is a public library, and a monument marks the spot where Nathan Hale the patriot spy was captured. A State fish hatchery and a biological school are situated here. The government is administered by town meetings, which are held biennially. Pop., 1900, 9,483, 1910, 12,004. Consult H. C. Platt, *Old Times in Huntington* (New York, 1876), Silas Wood, *Sketch of the Town of Huntington* (ib., 1898), Peter Ross, *History of Long Island* (ib., 1903), B. F. Thompson, *History of Long Island* (2 vols., ib., 1909).

HUNTINGTON. A city and the county seat of Cabell Co., W. Va., on the Ohio River, 20 miles east of Ironton, Ohio, on the Chesapeake and Ohio and the Baltimore and Ohio railroads (Map West Virginia, B 3). It is picturesquely situated and well laid out and has Marshall College (State normal school), the West Virginia Asylum for Incurables, a fine high-school building, and a Carnegie library. The city controls an important commerce, carries on a trade in coal, iron, and lumber, and has several wholesale establishments, shops of the Chesapeake and Ohio Railroad, large car works and foundry, a steel plant, machine shops, light-rail mill, a brewery, and manufactures of glass and china, furniture, picture frames, stoves, etc. Settled and incorporated in 1871, Huntington has adopted the commission form of government. The growth of the city has been rapid. Pop., 1900, 11,923, 1910, 31,161, 1914 (U. S. est.), 41,615.

HUNTINGTON, ARCHER MILTON (1870-) An American Hispanic scholar, adopted son of Collis P. Huntington. Born in New York City, he was educated there and in Spain. In 1898, for the Spanish government, he conducted important excavations on the site of the old Roman city of Italica, near Seville. The American Geographical Society and the American Numismatic Society chose him then honorary president. To the Hispanic Society of America, which he founded in 1904 and of which he became president, he gave a home in New York, an endowment, and rich collections, and in 1915 he gave jointly to the Academy and the Institute of Arts and Letters a site near the Hispanic, Numismatic, and Geographical societies. He received honorary degrees from Yale, Harvard, and Columbia. He edited *The Poem of the Cid* (3 vols., 1897), *Lady Aulmoy's Travels into Spain* (1899), with introduction, and several other Spanish texts, contributed to magazines, and is author of *A Note Book in Northern Spain* (1898) and *Sonnets* (1908).

HUNTINGTON, COLLIS POTTER (1821-1900). A pioneer American railroad builder, born at Harwinton, Conn., Oct. 22, 1821. Of a noted New England family, Collis P. Huntington early gave evidence of business initiative

—at 15 he started life peddling clocks in the South and West. In 1848 he went out to California and set up as a hardware merchant in Sacramento. With Charles Crocker, Mark Hopkins, and Leland Stanford he laid plans in 1859 for building the Central Pacific Railway, and credit for the completion of this work (1869) is due largely to Huntington's enterprise as fiscal agent for the group. Later, with his associates, Huntington built the Southern Pacific (completed 1881) and the Chesapeake and Ohio railroads, and in time he came to operate 44 branches or connecting railroads along continuous lines from Portland, Ore., via San Francisco and New Orleans to Newport News, Va. The Southern Pacific, of whose board of managers Huntington was president, also acquired large interests in steamship lines. (See RAILWAYS, *History*.) Especially interested in Indian and negro education, he gave liberally to Hampton and Tuskegee institutes, as a memorial to his mother he built a Congregational church in his native town, and to Westchester, N. Y., he presented a library. At the time of his death (which occurred at his camp in the Adirondacks, Aug. 13, 1900) Mr. Huntington possessed a fortune estimates of which ranged from \$35,000,000 to \$80,000,000. By bequest he left to the Metropolitan Museum, New York, Peale's portrait of Washington, and his \$3,000,000 collection of paintings as a whole he also bequeathed to this museum, the bequest to take effect after the death of his widow and his adopted son, Archer M. Huntington (qv). Besides other large benefactions, Mrs. Huntington in 1909 made a gift of \$750,000 to the American Geographical Society.

HUNTINGTON, DANIEL (1816–1906) An American historical, genre, and portrait painter. He was born in New York, Oct. 14, 1816, and was educated at Hamilton College. In 1835 he studied with Professor Morse and later with Inman, in 1839 he visited Italy, studying with Ferriero in Rome. He was elected member of the National Academy in 1840 and held the office of president from 1862 to 1869 and from 1877 to 1891. He was talented, of fine mind, and industrious, but unfortunate in his early environment and in his epoch—artistic taste in the United States was then at its lowest ebb.

His color is subdued but good, his style is unaffected, and, as the years passed, his technique improved greatly, showing that he was in touch and sympathy with new movements in art. He was chiefly engaged in portrait painting, but also produced historical and genre works of note. Two of his largest canvases are "Lady Washington's Reception Day" and the "Atlantic Cable Projectors," in the Chamber of Commerce, New York. Other works are "Florentine Girl" (1839), "Henry VIII and Catherine Parr" (1850), "Venice," owned by J. P. Morgan, New York, "Study in the Woods," owned by Mrs. C. P. Huntington, New York, "The Sibyl," Historical Society, New York, "Republican Court" (1876), Stuart collection, New York. Among his portraits are those of President Lincoln, Union League Club, New York, Gov. E. D. Morgan, New York University, Bishop Potter, Judge Blatchford (1879), United States District Court, New York, Rev. Dr. Adams (1883), Union Theological Seminary, New York, Hon. R. C. Winthrop, United States Congress. In the Metropolitan Museum,

New York, are his "Mei-y's Dream" and portraits of John David Wolfe, Cyrus W. Field, William C. Prime, and Mrs. Elizabeth U. Coles. Consult S. G. W. Benjamin, "Daniel Huntington," in *American Art Review*, vol. 11 (Boston, 1881).

HUNTINGTON, ELLSWORTH (1876–) An American geographer and explorer, born at Galesburg, Ill. Educated at Beloit College and at Harvard and Yale, he taught (1897–1901) in Turkey, became a research assistant in the Carnegie Institution, Washington, and after 1907 was instructor and then assistant professor at Yale. He participated in the Pumpelly expedition to Russian Turkestan (1903–04), in the Barlett expedition to Chinese Turkestan (1905–06), and in an expedition to Asia Minor (1909). Honors came to him from foreign geographical societies. His writings include *Explorations in Turkestan* (1905), *The Pulse of Asia* (1907), *Palestine and its Transformation* (1911), *Asia—A Geography Reader* (1912), *The Climatic Factor as Illustrated in And America* (1914).

HUNTINGTON, FREDERIC DAN (1819–1904) An American clergyman, the first Protestant Episcopal Bishop of central New York. He was born at Hadley, Mass., graduated at Amherst in 1839 and at Harvard Divinity School in 1842, and was pastor of the South Congregational (Unitarian) Church, Boston. In 1855 he became preacher at Harvard and Plummer professor of Christian morals there. In 1860 he left the Unitarian church to become an Episcopalian. Resigning his professorship, he organized a parish in Boston and was its rector until 1869, when he was consecrated Bishop of the newly created diocese of central New York. He then settled in Syracuse, where he remained until his death. Among his numerous works are *Lectures on Human Society* (1860), *Christ in the Christian Year* (2 vols., 1877–81), *The Golden Rule Applied to Business and Social Life* (1892). Consult Anna S. Huntington (his daughter), *Memoir and Letters of Frederic Dan Huntington* (Boston, 1906) and *Dootor Huntington Being Editorials from the Living Church, Sept. 4–11, 1909* (New York, 1909).

HUNTINGTON, HENRY OF See HENRY OF HUNTINGTON.

HUNTINGTON, JEDEDIAH (1743–1818) An American general in the Army of the Revolution, born in Norwich, Conn., the son of Jabez Huntington (1719–86). He graduated at Harvard in 1763, joined the American army at Cambridge, became a brigadier general in 1777, and took part in many important engagements until the close of the war, when he was brevetted major general in 1783. He was one of the organizers of the Society of the Cincinnati. He became collector of the port of New London in 1789 and held the office 26 years. In 1778 he was a member of the court-martial that tried Gen. Charles Lee and in 1780 of the one that condemned Major André.

HUNTINGTON, LUCIUS SETH (1827–86) A Canadian statesman. Born at Compton, Quebec, he studied law at Shebrooke and was called to the bar in 1853. He was a Liberal member of the Canada Legislative Assembly (1861–66), Solicitor-General for Lower Canada (1863–64), and member of the House of Commons (1867–82). The charges which he made in the House, for the Liberals, of a corrupt political bargain between Sir John A. Macdonald and Sir Hugh Allan (qv) in regard to the Cana-

dian Pacific Railway charter, aroused angry debate and country-wide party strife and effected a return of the Liberals to power in 1873. Huntington served as President of the Council in 1874-75 and as Postmaster-General in 1875-78. He published a political novel, *Professor Conant* (1884).

HUNTINGTON, SAMUEL (1732-96) An American lawyer and signer of the Declaration of Independence. He was born at Wyndham, Conn., on a farm, educated himself for the law, practiced at Norwich, represented that constituency in the General Assembly from 1765 to 1774, and became associate justice of the Superior Court (1774), of which, 10 years later, he became Chief Justice. From 1776 to 1784 he was a member of the Continental Congress, of which he was President, as the successor of John Jay, in 1779-80. From 1786 to his death Huntington was Governor of Connecticut—His nephew and adopted son, **SAMUEL HUNTINGTON** (1765-1817), graduated at Yale in 1785, was admitted to the bar in 1793, and in 1801 removed to Cleveland, Ohio. He passed the rest of his life in that State and held the offices of judge of the Superior Court, Chief Justice of the Supreme Court, State Senator, and Governor of the State from 1808 to 1810.

HUNTINGTON, WILLIAM EDWARDS (1844-) An American university dean and president. He was born at Hillsboro, Ill., served as private and first lieutenant in the Wisconsin Infantry in 1864-65, and was educated at the University of Wisconsin (A.B., 1870) and at Boston University (B.D., 1873, Ph.D., 1881), where he was dean of the College of Liberal Arts from 1884 to 1904, president of the university in 1904-11, and dean of the graduate department after 1911. In early life he was a Methodist minister, having been ordained in 1868, and he held pastorates in Massachusetts at Nahant (1870-71), Roslindale (1872-74), Newton (1875-76), Cambridge (1877-79), and Boston (1880-82).

HUNTINGTON, WILLIAM HENRY (1820-85). An American journalist, born at Norwich, Conn. He was in Paris as correspondent of the *New York Tribune* for 20 years, from 1858. His philanthropic work during the siege of Paris (1870-71) was important. He bequeathed his collection of medals, bronzes, porcelains, miniatures, engravings, and prints relating to Washington, Lafayette, and Franklin, to the Metropolitan Museum, New York.

HUNTINGTON, WILLIAM REED (1838-1909). An American Protestant Episcopal clergyman and author, born in Lowell, Mass. He graduated at Harvard in 1859 and in 1859-60 was an instructor in chemistry there. Entering the Episcopal ministry, he was rector of All Saints Church, Worcester, Mass., in 1862-83 and of Grace Church, New York, from 1883 until his death. Dr. Huntington always took a prominent part in public affairs. He was active in the movement for liturgical revisions and was long chairman of the Prayer-Book Revision Committee, and editor with Dr. Samuel Hart of the *Standard Prayer-Book* of 1892. He wrote *The Church Idea, an Essay toward Unity* (1870), *Conditional Immortality* (1878), *The Book Annulled Its Critics and its Prospects* (1886), *Short History of the Book of Common Prayer* (1893), *A National Church* (1898), *Sonnets and a Dream* (1904), *A Good Shepherd and Other Sermons* (1906).

HUNTLY, GEORGE GORDON, fifth EARL OF (?-1576). A Scottish statesman. He was educated for the Church, but gave up the idea of entering it upon the death of his elder brother and became sheriff of Inverness and the keeper of its castle (1556). Entering into the political plots of his time, he was more than once imprisoned and condemned to death. Mary, Queen of Scots, released him and restored his estates and title, with a view to gaining his adherence, but he refused to turn Catholic to please her, though he sided with his brother-in-law, Bothwell, in the troubles that followed. Huntly tried to rescue Rizzio and was a main mover in the murder of Darnley as well as in the Queen's subsequent marriage to Bothwell, to which he was a witness. He conspired to rescue his royal mistress from Lochleven (1568) and raised troops in her service, but his lifelong enemy, the Earl of Murray, vanquished him at last, and Huntly's resolve to give up her cause as hopeless was Mary's chief reason for surrendering to Elizabeth. Consult J. H. Burton, *The History of Scotland* (Edinburgh, 1867-70).

HUNTOON, hūn-tūn', **LOUIS DOREMUS** (1869-) An American mining engineer. He was born at Paterson, N. J., and graduated from the New York College of Pharmacy in 1890 and from the School of Mines (Columbia) in 1895. He was a chemist and assayer in Colorado (1895-96) and mining and metallurgical engineer in New York (1896-1903), served as assistant professor (1904-08) and professor (1908-11) of mining and metallurgy at Sheffield Scientific School (Yale), and was consulting engineer in New York City after 1911. He became a contributor to the *NEW INTERNATIONAL ENCYCLOPEDIA*.

HUNTSMAN (BENJAMIN) PROCESS. See IRON AND STEEL, METALLURGY OF, under *Crucible Process*.

HUNTSVILLE. A town in Muskoka Co., Ontario, Canada, on the Grand Trunk Railway (Map Ontario, E 3), 145 miles north of Toronto. Its manufacturing establishments include several lumber mills, a tannery, leather factory, and machine shop. The town owns its lighting system and water works. It is a summer resort. Pop., 1901, 2152, 1911, 2358.

HUNTSVILLE. A city and the county seat of Madison Co., Ala., 111 miles by rail north of Birmingham, on the Southern and the Nashville, Chattanooga, and St. Louis railroads (Map Alabama, C 1). It is in the fertile valley of the Tennessee River and has important farming, cotton-growing, and stock-raising interests. There are cotton mills, a foundry, machine shops, saw mills, sash and blind factories, oil and fertilizer mills, a fibre factory, etc. Among the educational institutions are a State normal and industrial school and the Goodrich Training School. Other features are the high school, famous Big Spring, and Monte Sano. Huntsville has adopted the commission form of government. The city owns its water works. Settled in 1775, Huntsville was first incorporated in 1800. At one time it was the capital of the State. Pop., 1900, 8068, 1910, 7611, the decrease being due to the narrowing of the city's corporate limits.

HUNTSVILLE. A city and the county seat of Randolph Co., Mo., 122 miles east of Kansas City, on the Wabash Railroad (Map Missouri, D 2). It has coal mines, manufactures agricultural implements, and trades in coal, farm

produce, live stock, etc. The water works are owned by the city. Pop, 1900, 1805, 1910, 2247.

HUNTSVILLE A city and the county seat of Walker Co., Tex., 74 miles north of Houston, on the International and Great Northern Railroad (Map Texas, E 4). It is an important cotton market, has trucking and live-stock interests, and manufactures cotton goods, cottonseed-oil, lumber, wagons, furniture, steam engines, boilers, cigars, etc. The city has the Sam Houston Normal School (State), the State penitentiary, and, of historic interest, the old home and grave of Gen. Sam Houston and the grave of H. Yokum, the first historian of Texas. Huntsville was first settled about 1836. The government is administered by a mayor, elected every two years, and a unicameral council. Huntsville owns its water works. Pop., 1900, 2484, 1910, 2072.

HUNYADY, hun'yō-dī, JÁNOS (John Hunyades) (c 1387-1456). The national hero of Hungary. His origin is shrouded in obscurity. He saw his first military service under King Sigismund. Under Sigismund's successor, Albert II (1438-39), he became known as a brilliant soldier and was ban of a district on the borders of Transylvania, exposed to the Turkish attacks. It was the period when the Turkish power was at its height, and it seemed within the range of possibility that the Mohammedans would obtain possession of the greater part of the Danube valley and seriously menace Western civilization. To Hunyady, more than to any other one man, Europe owes it that the danger was averted. Albert died in 1439, and as there was no male heir, the nobles elected King Ladislas, of Poland, to the Hungarian throne. Meanwhile the wife of Albert gave birth to a son, Ladislas Posthumus, and a civil war resulted, of which the Turks took advantage. Hunyady, however, defeated them in several battles, and in 1443 an advantageous peace was made. Nevertheless King Ladislas, incited by the papal legate, Julian Cesarini, began war again, and on Nov. 10, 1444, the Hungarian army under Ladislas and Hunyady was overwhelmed at Varna. Ladislas was among the slain, whereupon Ladislas Posthumus was recognized by all parties as King, and Hunyady was made Regent during the minority. War was actively carried on both against the Turks and Frederick III. In 1448 Hunyady was completely defeated by the Turks at Kossovo, after which he was held prisoner for a short time by the Servians. His most splendid achievement was the defense of Belgrade in 1456 against the army of Mohammed II, the conqueror of Constantinople, in which he was aided by the celebrated Giovanni da Capistrano (qv). The Turkish attack began about June 15, 1456, and on July 14 Hunyady forced his way into the city, while Szilágyi, the commander of the town, made a sortie, and finally, on July 21, the Turks were decisively repulsed and raised the siege, having lost 80,000 men. A few days after this glorious victory the plague broke out in the army, and Hunyady, the great Christian hero, after a short illness fell a victim to the disease. He left two sons, Ladislas and Matthias Corvinus. The former was treacherously imprisoned and beheaded at Buda by Ladislas Posthumus. Matthias, generally known as Matthias Corvinus, became King of Hungary in 1458. Consult Bain, "The Siege of Belgrade," in the *English Historical Review*, vol. vii (London,

1892), László Szalay *Geschichte Ungarns*, vol. iii (Budapest 1874). Armin Vámbéry, *Story of Hungary* (New York, 1894).

HUNZAS, hūn'zaz. One of the Aryan tribes of Dardistan, inhabiting the district about Hunza.

HUON DE BORDEAUX, u'ōn' de bōr'dō'. A French *chanson de geste*, probably belonging to the thirteenth century and then somewhat altered when rewritten for Charles Seigneur de Rochefort, early in 1454. The oldest printed edition is in folio and without date, the second, in quito, bears the date 1516. The English translation was made by Lord Berners, in Henry VIII's time. The subject has proved a tempting one for poets, the famous *Oberon* of Wieland and Weber's opera of the same name being among the poems founded upon it, while Shakespeare drew from it in the *Midsummer Night's Dream*. A prose adaptation has been issued by Gaston Paris (1899). Consult Gaston Paris, *Poemes et légendes du moyen-âge* (Paris, 1899), Charles Voretzsch, *Epische Studien*, vol. 1 (Halle, 1900). Gustav Grober, *Grundriss der romanischen Philologie* (Strassburg, 1902), Albert Counson, *La légende d'Obéon* (Brussels, 1903), J. Bedier, *Les légendes épiques* (Paris, 1908).

HU'ON PINE. See DACRYDIUM.

HUPA, hū'pa. A tribe of Athabascan stock, originally occupying a number of small villages on the lower Trinity River, Cal., and now gathered on the Hupa Valley Reservation in the same region. In their pristine condition they subsisted chiefly upon salmon, dried and smoked, and acorns made into flour and porridge. They were noted for the variety and beauty of their basketry. They now number 639, not including some remote tribes. Our knowledge of the ethnology of this tribe is derived entirely from P. E. Goddard's *Life and Culture of the Hupa*, in the publications of the University of California, vol. 1 (1903).

HUPEH, hu'pē (Chin., north of the Lake). One of the 18 provinces of China proper, situated in the very centre of the country and surrounded by the populous and important provinces of Hunan on the south, Szechwan on the west, Shensi and Honan on the north, and Anhui on the east (Map China, K 5). The Yang-tse from west to east runs through its southern part, while the Han, in its tortuous course from the northwest, irrigates its fields and provides a splendid waterway for its commerce. The province is mountainous in the north, being penetrated with spurs and outlines from the Ta-pa-shan and Fu-mu mountains. Towards the centre and southwest it is low-lying, forming an extensive triangular plain, admirably suited to the growth of cotton, and covered with many marshes, shallow lakes, and lagoons, the remains of that portion of the Tung-ting Lake which formerly spread much farther north than it does now. These sheets of water have been connected by navigable ditches and serve as a safe short cut for the smaller class of native junks from Shashu (on the Yang-tse opposite the entrance to the Tung-ting) to Hankow, or to towns farther up the Han.

The area of the province is estimated at 71,400 square miles, and the population at 24,900,000 according to the Chinese census of 1910 and 34,000,000 according to the customs estimate. The capital is Wuchang, on the Yang-tse, oppo-

site Hankow. The great iron and steel works are at Hanyang on the Han, across from Hankow. The combined population of these three cities is estimated at 870,000. There are three treaty ports in Hupeh—Hankow, Ichang (pop., 55,000), and Shasi (95,000). Hupeh is a favored province for modern industries because of its extensive coal fields. Both coal and iron are actively mined by modern methods. There is at present a little opium grown in the province, but the laws are being drastically enforced, and all opium cultivation will doubtless soon disappear.

HUPFELD, hūp'fēlt, HERMANN (1796-1866). A German theologian and Orientalist. He was born in Marburg, studied at the university there, was professor of theology and Oriental languages from 1825 to 1843. In the latter year he succeeded Gesenius at Halle. His most important work is the *Uebersetzung und Auslegung der Psalmen* (3d ed., 1898), characterized by sound scholarship. His further publications include *Exercitationes Æthiopice* (1825), *Die Quellen der Genesis* (1853), *Die heutige theosophische und mythologische Theologie und Schriftexegese* (1861). Consult Riehm, *Dr Hermann Hupfeld* (Halle, 1867).

HURA, hū'ra (Neo-Lat., from the native name). A genus of euphorbiaceous plants. *Hura crepitans*, a native of the West Indies and tropical America, is a tree which abounds in a very acrid milky juice and has stalked, heart-shaped, acuminate, leathery leaves. The fruit is a woody capsule, of the size of a large apple, very much flattened, formed of 12 to 15 carpels, each containing a large seed. These carpels surround a common axis and separate with great elastic force. The tree is called sandbox tree, because, before the use of blotting paper became general, the capsule was generally used in the West Indies as a sandbox for powdering letters with fine sand. The seeds are a violent drastic purgative.

HURALT, hū'alt, PHILIPPE. See CHEVERNY, COUNT DE.

HUR'AM. See HIRAM.

HURD, HENRY MILLS (1843-) An American psychiatrist, born at Union City, Mich., and educated at the University of Michigan (A.B., 1863, M.D., 1866). He was superintendent of the Eastern Michigan Asylum at Pontiac in 1878-89 and thereafter served as professor and professor emeritus (1906) of psychiatry at Johns Hopkins University, and until 1911 as superintendent of the Johns Hopkins Hospital. He was president of the American Academy of Medicine (1896), of the American Medico-Psychological Association (1898-99), and of the American Hospital Association (1912). He edited the Johns Hopkins bulletins and reports (1890-1911), was coeditor of the *American Journal of Insanity* after 1897 and of the *Modern Hospital* after 1913, and with John S. Billings he is author of *Hints to Hospital Visitors* (1895), and editor of *Hospitals, Dispensaries, and Nursing* (1893).

HURD, RICHARD (1720-1808). An English prelate. He was born at Congreve in Staffordshire, Jan. 13, 1720, studied at Cambridge University, and became fellow of Emmanuel College in 1742. In 1749 appeared anonymously his first notable production, *Commentary on Horace's Ars Poetica*, in which he advocated the now discredited theory that the poem was a systematic criticism of the drama of the Romans. In

1750, on Warburton's recommendation, he was appointed one of the Whitehall preachers. He became Bishop of Lichfield and Coventry (1775) and in 1783 declined the archbishopric of Canterbury. He died at Hartlebury Castle, May 28, 1808. His principal works are *Moral and Political Dialogues*, in which historic characters are introduced as interlocutors on such themes as sincerity, retirement, the golden age of Elizabeth, and the constitution of the English government (1759), *Letters on Chivalry and Romance* (1762), and *An Introduction to the Study of the Prophecies Concerning the Christian Church, and Particularly Concerning the Church of Papal Rome* (1772). He edited the *Works of Warburton* and of Cowley. His complete works with life appeared in eight volumes (London, 1811). Consult his life by F. Kilvert (London, 1860).

HURDWAR, hērd-war'. See HARDWAR.

HURDY-GURDY (of onomatopoeic origin). A very old musical instrument of the stringed kind, which, under the name of *leyer*, or *Bauernleier*, spread from its native country Germany, over a great part of Europe. The hurdy-gurdy consists of a flat, oval-shaped sounding board, over which the strings are stretched, with a back or bottom of the same size and shape. These are bound together by tolerably deep sides, or ribs. On one side are from 10 to 12 finger keys, for shortening the sounding lengths of the strings when required. There are four strings of gut which are put into a state of vibration by being rubbed by the edge of a small wooden wheel charged with rosin and turned by a handle. Two of the strings are tuned in unison as a keynote, or one of them a fifth above, they are placed out of reach of the keys and form a sort of drone bass. The other two strings are acted on by the keys and produce a diatonic scale of from 10 to 12 notes. The hurdy-gurdy is suited only to simple music and was used for such as had many repetitions. From the tenth to the twelfth century it was one of the most popular instruments, but was then superseded until the eighteenth, when it again, and especially in France, became very popular. It is now nearly obsolete. The name is also colloquially applied to a large street or barrel organ (qv). For illustration, see **MUSICAL INSTRUMENTS**. Consult H. Lapaire, *Vielles et cornemuses* (Paris, 1901).

HURGRONJE, CHRISTIAN SNOUCK. See SNOUCK HURGRONJE.

HURLBUT, JESSE LYMAN (1843-) An American Methodist Episcopal clergyman. He was born in New York City, graduated at Wesleyan University in 1864, and held pastorates at Newark, Montclair, Paterson, Plainfield, Hoboken, Morristown, Orange, and Bloomfield, N. J. After 1879 he was connected with the Sunday-school and tract work of his denomination. He was secretary of the Epworth League in 1889-92 and for some time was associated with Dr. J. H. Vincent in the direction of the Chautauqua Literary and Scientific Circle. From 1909 until his retirement in 1914 he was district superintendent of the Newark District. Among his works are *Manual of Biblical Geography* (1882), *Outlines in Old Testament History* (1890), *Our Church* (1902), *Story of the Bible* (1905), *Outline Studies in the New Testament* (1906), *Teacher Training Lessons* (1908), *Organizing and Building up the Sunday School* (1909), *Traveling in the Holy Land*

through the Stereoscope (1913), *The Superintendent's Helper* (1915)

HURLBUT, STEPHEN AUGUSTUS (1815-82) an American soldier and diplomat, born in Charleston, S C. He studied law, was admitted to the bar in 1837, and practiced in Charleston until 1845, when he removed to Belvidere, Ill. He was a Whig member of the Illinois State Constitutional Convention in 1847, served as a Whig residential elector in 1848, was in the State Legislature from 1859 to 1861, and in May, 1861, became a brigadier general of volunteers. He commanded a division at Fort Donelson, after its capture, and at Shiloh, was promoted to be major general of volunteers in 1862, commanded the Sixteenth Army Corps during Sherman's Mississippi campaign of 1864 and succeeded General Banks as head of the Department of the Gulf. He was returned to the Illinois Legislature in 1867 and was a Republican presidential elector in 1868. From 1869 to 1872 he served as United States Minister to Colombia, was a member of Congress from 1873 to 1877, and in May, 1881, he was appointed United States Minister to Peru, where he died the following year.

HURLEY A village and the county seat of Iron Co., Wis., on the Montreal River, opposite Ironwood, Mich., 39 miles east by south of Ashland, on the Chicago and Northwestern, and the Minneapolis, St. Paul, and Sault Sainte Marie railroads (Map Wisconsin, C 2). It is in the productive Gogebie iron-mining district, several large mines being in the vicinity, and is engaged to some extent also in lumbering, farming, and stock raising. Pop., 1914 (local est.), 600.

HURLING A field sport, formerly much played in Ireland, akin to the more modern game of hockey (qv). It is played to-day on a field 150 X 84 yards, with goals at each end, having posts 21 feet apart and a crossbar 8 feet high, and two point posts 6 feet high, 21 feet on each side of the goal posts. The field is lined across, parallel with the goals, at 21 and 50 yards, and halfway down the hurley stick approximates to the ice-hockey stick in shape, but is held with the left hand below the right. The ball, or shtter, is of cork, round round with woolen threads and covered with leather. It is 5 inches in diameter and weighs 7 ounces. Play is begun by the 17 or 20 players on each side facing each other in the center of the field. The referee then throws the ball between the two lines of players, who thereupon scatter to their respective positions in the field. The object of the players is to drive the ball through the space between their opponents' goal posts. If the ball passes over the side line, previously appointed sidesmen throw it back into play. The ball may be caught with the hand, but must be at once played with the hurley. In a scrimmage, when the hurleys are cocked, the ball may be moved with the foot. There are some very pretty strokes made with the hurley, notably that where the ball is raised in the air with the point and hit forward as it falls.

HURLOTHURMBO An operative burlesque, written by one Samuel Johnson, a Cheshire dancing master, in 1723, and produced at the Haymarket, April, 1729.

HURON, hū'rōn A city and the county seat of Beadle Co., S. Dak., 120 miles east of Pierre, on the Chicago and Northwestern and the Great Northern railroads (Map South Dakota, F 3).

It is in a fertile agricultural and stock-raising region, is a division headquarters of the Chicago and Northwestern Railroad, with machine shops, roundhouses, etc. and has flour mills and grain elevators, carriage and wagon shops, a brickyard, a creamery and other industries. Huron is the seat of Huron College (Presbyterian) and contains fine high-school and government buildings. The city adopted the commission form of government in 1910. It owns its water works. Pop., 1900, 2793, 1910, 5791.

HURON An Indian tribe. See WYANDOT.

HURON, hū'rōn'. The name of certain animals of the family Mustelidae. See GRISON.

HURON, hū'rōn, LAKE One of the five Great Lakes on the north frontier of the United States, between Lake Superior on the northwest and Lake Erie on the southeast, connected with Lake Michigan on the west, and bounded on the southwest by Michigan and on the north, east, and south by the Province of Ontario (Map United States, K 2). It is the second in size of the Great Lakes, having a total area of 23,200 square miles and being 235 miles long from the St. Clair River to the Straits of Mackinac and 98 miles wide along the forty-fifth parallel. A large arm of the lake in the east, extending far into Ontario and known as Georgian Bay, is 125 miles long and 60 miles in maximum width. Lake Huron receives the waters of Lake Superior through the St. Mary's River and those of Lake Michigan through Mackinaw Straits. Its outlet is the St. Clair River flowing into Lake St. Clair, which is connected by Detroit River with Lake Erie. A slight current follows the west shore from inlet to outlet. The general direction of the lake lengthwise is from north-northwest to south-southeast. The surface is 9 feet above the level of Lake Erie, 335 feet above Lake Ontario, and 581 feet above the sea, with occasional fluctuations as in the other lakes. Its maximum depth is 802 feet in the main body, while that of Georgian Bay is somewhat more than 300 feet near its western shore. The waters are very clear and cold, especially in the northern part, and abound in fish, of which the whitefish is the most important.

There are few harbors on the west side, but vessels find shelter in Saginaw Bay (50 miles long by 26 miles wide at its mouth), about 70 miles north of the outlet, and also in Thunder Bay, as much farther north and about 78 square miles in area. Presque Isle is also a fair harbor, and there is good shelter under the south side of the island of Mackinaw. The lake is subject to violent storms, but navigation is safe from May 1 to December 1. Mackinaw has long been an important port for fur trade with the Indians. Bay City, at the head of Saginaw Bay, is an important lumber depot, and copper mines have been opened in the upper portions of Manitowlin Bay. Excellent grindstones are cut from the sandstone near Thunder Bay. The main body of water is unbroken by islands, but there is a group of islands in the north, most of them belonging to Canada, the largest of which is Grand Manitowlin. There is much geological evidence to the effect that Lake Huron was formerly deeper and more extensive than at present. Consult E. P. Moulton, *Lake Huron and the Country of the Algonquins* (Chicago 1913). See GREAT LAKES.

HURO'NIAN SERIES See PRE-CAMBRIAN FORMATIONS.

HURRICANE. See STORM, WIND.

HURRUR, hūi-rūi See HARRAR

HURST, JOHN FLETCHER (1834-1903) An American Methodist Episcopal theologian, bishop, and educator. He was born near Salem, in Dorchester Co., Md., graduated at Dickinson College in 1854, and studied theology at the universities of Halle and Heidelberg. After his return to America he held a pastorate in New Jersey from 1858 until 1866. Again going to Germany, for three years he taught theology at the Mission Institute in Bremen and at Frankfurt-on-the-Main, and then traveled extensively in Europe, Syria, and Egypt. In 1871 he was chosen professor of historical theology in the Drew Theological Seminary, Madison, N. J., becoming its president two years later. In 1880 he was elected Bishop, and spent much time visiting missions and conferences in Europe and India. In 1891 he was chosen chancellor of the American University, Washington, which he had helped to found. He wrote and translated numerous works on Church history, including a *History of Rationalism* (1865), *Martyrs to the Tract Cause* (1873), *Our Theological Century* (1876), *Bibliotheca Theologica* (1883), *The Literature of Theology* (1896), a *History of the Christian Church* (2 vols., 1897-1900), *History of Methodism* (7 vols., 1904). Consult Albert Osborn, *John Fletcher Hurst* (New York, 1905).

HURTADO DE MENDOZA, ōi-ta'dō da mān-dō'tha, GARCIA, MARQUIS OF CAÑETE (1535-1603). A Spanish administrator, born at Cuenca. He fought in Italy and Germany, but by 1557 was Governor of Chile, where he took part in the local wars. Returning to Spain in 1561, he held numerous diplomatic posts and fought in the war against Portugal. From 1590 to 1596 he was Viceroy of Peru. Consult M. de Mendiburu, *Diccionario histórico-biográfico del Perú*, vol. IV (Lima, 1880).

HURTADO DE TOLEDO, dā tō-lā'dō, LUIS (c.1530-1591). A Spanish poet, born at Toledo, who in recent years gained an ephemeral celebrity by being credited with the authorship of the famous romance of chivalry (second only to the *Amadis de Gaula*), *Palmerin de Inglaterra*. This attribution has been abandoned, and Luis Hurtado turns out to have been, with regard to this work, only a very poor translator of a Portuguese original, and even this assignment is disputed. It seems safe to credit him only with the authorship of several minor works and with the completion of others. Consult Perálvarez de Ayllón y Luis Hurtado de Toledo, *Comedia Trilalda* (ed. Bonilla y San Martín, *Biblioteca Hispanica*, vol. XIII, Madrid, 1903), and the searching study by W. E. Puizer, *Palmerin of England* (Dublin and London, 1904).

HURTER, hur'tēr, FRIEDRICH EMANUEL VON (1787-1865). A Swiss historiographer. He was born at Schaffhausen and educated there and at Göttingen. He was pastor at Beggingen (1808) and at Löhningen and in 1835 was made dean and antistes of the Reformed synod. After the publication of his *Geschichte des Papstes Innozenz III und seiner Zeitgenossen* (1834-42), he became a Roman Catholic (1844). At about the same time he published *Die Befehdung der katholischen Kirche in der Schweiz seit 1831* (1842-43) and *Geburt und Wiedergeburt* (1845), an apologia for his conversion. In 1846 he settled at Vienna and was made historiographer to the Emperor of Austria. Under the liberal rule of Pölsersdorf he resigned this position, but

was reappointed in 1851. His other historical works include *Geschichte des ostgothischen Königs Theodorich* (1807), *Denkwürdigkeiten aus dem letzten Decennium des 18. Jahrhunderts* (1840), *Philipp Lang, Kammerdiener Rudolfs II* (1851), *Zur Geschichte Wallensteins* (1855), *Wallensteins vier letzte Lebensjahre* (1862). Consult Heinrich von Hurter, *Friedrich von Hurter und seine Zeit* (2 vols., Gratz, 1876-77).

HUSBAND AND WIFE A man and a woman married to each other. As marriage is a status recognized by law, it is obvious that it will alter the legal relations of the parties to it, not only as between themselves but also with respect to other persons. The new relation creates new rights and duties of a reciprocal nature, and at the same time new responsibilities with respect to the state, the community, and the individuals who come into relation with it. It is not so obvious, however, that the rights and obligations so arising should be unequal, that one member of the new relationship should come under dominion of the other and at the same time lose his or her legal identity, or the rights and responsibilities of a member of the community—in other words, cease in greater or less degree to be what legal philosophers call a "juristic person." Yet this has, in all legal systems of which we have any knowledge, at least in the earlier stages of their development, been the consequence of marriage to the woman.

Roman Law In the early period of the Roman law the power of the husband over his wife and her property was absolute, as the *patria potestas*. Whatever property the wife acquired, both before and after marriage, became the property of the husband, but in case the wife survived the husband she was entitled to share her husband's property equally with the children. At a later period, but before the time of Justinian, owing possibly to the lack of any formal marriage, we find a fully developed system of law relating to married women which, unlike the common law, was based upon the theory that husband and wife were in law distinct persons having independent rights and liabilities. The wife remained responsible for her own debts. She could sue and be sued independently of her husband, and her husband could not subject her property to any disability. While there were some restrictions upon the power of women to contract, there was no distinction in this respect between married women and unmarried women. The husband, as at common law, was bound to support the wife, but as compensation for this liability his wife or her family was required at the time of the marriage to provide the husband with the *dos*, or dowry. The increase from the *dos* was the husband's property. He could also dispose of the *dos* so far as it was personal property, but not if it were real estate, and in the case of termination of the marriage by death or divorce, the *dos* was required to be returned to the wife. Corresponding to the *dos* was the *donatio ante nuptiam* or the *donatio propter nuptiam*, a gift made by the husband to the wife before the marriage. Not much is known of these, but it seems probable that the *donatio* was not required to be equal to the *dos*, but was given as a provision for the wife after her husband's death, she having lost the right to share equally in her husband's property with the chil-

dren of the marriage. These rules of law might, however, be freely modified by antenuptial contracts, which were enforced much as courts of equity enforced antenuptial contracts entered into at common law.

Common Law. In the common-law system of England and the United States the effects of marriage may be considered in two aspects: first, as regards the persons and the personal rights of the husband and wife, and, second, as regards their property relations.

1. *Personal Relations.*—By marriage at common law the husband became legally bound to support the wife in a manner consistent with his resources and social position. He also became bound to pay all debts contracted by her before the marriage, and when sued with the wife became responsible for her torts committed either before or during coverture. In all other respects he remained in precisely the same position as before marriage. Independently of his wife he could sue and be sued, enter into contracts with others, bind himself as fully after as before marriage, and he could make a will bequeathing all his property to strangers subject only to the wife's right of dower in his legal estates of inheritance. As regards the person and personal rights of the wife, however, there was a material difference. Her person was said to be merged in that of her husband, and for many purposes they were treated as one person in the eye of the law. The wife could neither sue nor be sued independently of the husband. Her contracts were wholly void, even when made with her husband. Even the personal property she had before marriage became her husband's absolutely, and he could dispose of it at will. She had no power to make a will of real estate, and her will disposing of personal property owned by her before her marriage could be effective only when authorized or consented to by the husband at her death. As the husband, however, was bound to support the wife, she had authority in law without his consent to pledge his credit for necessities supplied by third persons. Necessaries are any articles of personal use, as food or wearing apparel, which are suited to the rank and position in life of the husband, and with which the wife is not provided. Therefore, if goods were ordered by the wife which were not necessary, the husband was under no legal liability to pay for them unless he expressly or impliedly ratified his wife's act in purchasing them. Though the husband was bound to maintain his wife, there was no direct means of enforcing this duty. The wife could not sue the husband herself, but, as she had an implied authority to order necessities, the tradesman so supplying them could sue the husband for the price. The wife also might impose liability on the husband by contract for articles not necessities by virtue of an implied authority as agent of the husband to purchase such articles; thus, a husband was liable to pay for articles such as he had regularly permitted his wife to purchase on his credit before, although he knew nothing of the particular purchase in question. See AGENT.

The husband, being entire master of his own actions, has the power to decide where to live, and the duty of the wife is to live with him in the same house. So long, then, as the husband and wife continue to live together, the domicile of the wife is determined by the domicile of the husband. If she ceases to live with her husband,

she may then acquire an independent domicile. If the wife lives apart from the husband without just cause, he is not bound to support her even with necessities. If, however, she separates from him for just cause, the liability of the husband for necessities continues. There are, at common law, several just causes for her living apart from her husband. If the husband, e.g., treats her with what is deemed cruelty in the eye of the law, as keeping a mistress in the house, or starving her, or assaulting her, she is entitled to leave him and can order necessities at his expense from any tradesman willing to supply her. There are, however, many degrees of cruelty and ill usage for which the wife has practically no remedy, and of which the law can take no cognizance. The statement frequently found in the early treatises that the husband has at common law the right reasonably to chastise the wife was probably without authority and certainly has no support in modern law. The husband can enforce the wife's antenuptial contracts and can recover for torts committed towards her either before or after the marriage by joining her with himself as plaintiff in an action. For torts resulting in loss of her services to him or requiring him to provide medical attendance or other necessities he can recover in his own name and right. He may also recover damages from a third person for unlawful intercourse with his wife, and either husband or wife might recover damages from a third person for alienating the affections of the other. As regards crimes committed by a wife, she is in general liable to be punished for them in the same way as if she were unmarried. But there is a peculiarity as regards crimes committed by the husband and wife jointly in the husband's presence. If the crime be treason or murder, both are punished precisely as if they were unmarried. But in all the lesser crimes the theory, as well as the practice, is that if the wife was a party to the crime, and committed it in her husband's presence, she is presumed by the law to have so acted under the compulsion or coercion of her husband and is acquitted as a matter of course. The presumption may, however, be rebutted by showing that in fact the wife was not coerced by the husband, but in the absence of any direct evidence one way or the other it is presumed that the wife acted under this marital coercion, and so she escapes punishment. Another curious anomaly arising from the doctrine that husband and wife are in law one person is that the wife cannot be convicted of stealing her husband's goods. If she absconds with his property, however valuable, she cannot be punished. But this rule is qualified by the circumstance that if she commits adultery and afterward absconds with the adulterer, both taking away the husband's goods, the adulterer may be convicted of the larceny, though it is doubtful if she is in that case liable to any punishment.

At the common law, also, husbands and wives may be witnesses for or against other parties in all civil cases, i.e., actions and suits relating to debts, contracts, and wrongs which are not crimes, and in all inquiries of a civil nature. But neither can testify for the other in an action to which the other is a party, though either can be compelled by the opposite party to be a witness. In no case can husband or wife be compelled to disclose any confidential communication made to him or her by the other during

coverture As regards all criminal proceedings instituted against either husband or wife, the other spouse is neither competent nor can be compelled to be a witness, but where the husband and wife are not the accused, but are the prosecuting parties, then, inasmuch as the state is presumed to be the prosecutor, and the husband and wife are not, strictly speaking, parties to the action, they may both be witnesses, subject to the qualification as to not being bound to disclose confidential communications made by and to each other during marriage There is an exception also to the rule that neither can be a witness against the other in criminal proceedings—viz, where the wife charges her husband with an assault or other crime of greater degree upon her person She is in that case a competent witness against him, for otherwise the crime might go unpunished Moreover, in all proceedings instituted in consequence of adultery of the husband or wife, neither of the married parties is competent or can be compelled to be a witness against the other

2 *Property Relations*—As regards the husband, he not only remains sole owner of his property and, subject to the wife's right of dower, can do what he likes with it, but he becomes absolute owner of her personal property of every kind which is capable of being reduced to possession As will be hereafter explained, he also becomes a qualified owner of her choses in action (qv) and her chattels real The legal title of the wife's real estate remains in the wife, but she cannot convey it without the husband joining in the conveyance, and the rents, issues, and profits of her real estate belong absolutely to her husband As a consequence of the common-law rule that the husband is entitled to the services of the wife, he becomes entitled to her earnings acquired by rendering service to others It will thus be seen that during coverture the wife cannot, at common law, acquire any personal property in her own right, and her title to real property acquired before or after her marriage is subject to the rights of the husband, as stated The old rule as to the wife's personal property becoming the husband's absolutely after marriage suffered qualification when such property consisted not of money or chattels, but of what are called chattels real, such as leases and mortgages (See CHATTEL) In such a case they become so far the property of the husband that he can sell them during his life, but he cannot bequeath them by will, and on his death they remain hers, while on her death they become his Again, where the wife's personal estate before marriage includes rights of action, or debts due to her, these become so far his that he can at any time sue for them and so reduce them into possession and make them his own absolutely, but he cannot bequeath them by will, and if he does not sue for them in his lifetime they survive to the wife after his death As regards the wife's real estate—i.e., her lands and houses held in freehold—the husband acquires a qualified legal interest (he is said to be jointly seised with his wife), which, as has been pointed out, entitled him to the rents, issues, and profits, and consequently to lease the real estate during the coverture, and if the wife bear him a living child, upon her death he becomes entitled to a life interest in her real estate, known as tenancy by the curtesy (qv) Upon marriage the wife also acquires an inchoate right to dower in any and all

estates of inheritance of which the husband may be or become seised during coverture—i.e., a life estate in one-third of all such real estate This right becomes complete only upon death of the husband before the wife, but it cannot be impaired by any act of the husband during the coverture or by the wife herself except by joining with her husband in a conveyance to a third party (See DOWER) All real estate conveyed to husband and wife together, unless otherwise defined by the instrument of conveyance, is deemed to be an estate known as an *estate by the entirety* Its peculiarity is that while the husband is entitled to the rents, issues, and profits during coverture, neither can convey the title, nor his or her interest therein, without the other, and upon the death of either the survivor becomes entitled to the property absolutely On the death of the husband, the wife surviving, she becomes entitled only to her paraphernalia, so called, which consists of her personal apparel and jewels, but even these may be taken by her husband's creditors if there be a deficiency of assets When the wife dies before the husband, he becomes entitled to all her personal estate, of whatever description, even though she leave children of the marriage, and it must be recollected that she can at the common law, generally speaking, make no will which has any effect if the husband chooses to repudiate it The wife's real estate passes to her heirs subject only to the husband's right, as tenant in curtesy, to hold it for his life The English courts of chancery, by application of the doctrine of uses and trusts (qv), mitigated to some extent the harshness of the common-law rules relating to the property rights of married women By an antenuptial agreement between the parties to the marriage, called a marriage settlement, or by other means, not only all the property she may have had before marriage, but property to which she may afterward become entitled, may be given to trustees to hold for her separate use The settlement may give her a practically unlimited right of control over the property thus settled upon her which equity would enforce and she may thus receive regularly the income of the trust and use of it for her own purposes She may bind this separate estate by contract and even dispose of it by will Courts of equity will also in a proper case enforce agreements made between husband and wife, and in certain cases will enforce a conveyance made by the husband to the wife when made for the purpose of providing for the wife The various rights thus created and enforced by the courts of equity are known as married women's separate estates

Statutory Changes The preceding statement is an outline of the rights and obligations of the husband and wife as developed in the courts of common law and equity Half a century ago public attention was first directed towards the essential injustice of the prevailing law to the married woman The agitation which followed took fast hold upon the public conscience and ultimately found expression, both in England and the United States, in a series of statutes known as married women's enabling acts New York was the first State to adopt this reform, by an Act passed in 1848, and its example was followed by other States in rapid succession The various statutes relating to the subject have been repeatedly revised, and their scope widened by amendment, until at the pres-

ent time in most jurisdictions, though the statutes differ in minor particulars, married women are on a substantial equality with their husbands with reference to both personal rights and rights of property, and each is practically independent of the other with reference to all matters outside the marriage relation itself. In all jurisdictions the husband is still under the common-law obligation to support his wife and to provide her with necessaries, and the wife, by acting as his agent, may still bind the husband by contract. As the husband no longer acquires any interest in the wife's personal property or choses in action, he is not subject to the corresponding obligation to answer for her torts and contracts, they being an obligation of the wife alone, for which she may be separately sued. Either may sue or be sued independently of the other. While the husband may no longer take the wife's earnings, he is in a general sense still entitled to her services, so long as she continues to give them to him, and he may sue in his own right to recover for torts causing loss of her services, and either may sue for alienation of the affections of the other. The law of domicile of the husband and wife remains unchanged, the husband's domicile being deemed that of his wife. The wife still has dower in the husband's real estate, except in some States in which she has been given the right of inheritance in lieu thereof, and in some of the Southern and Western States she has by statute a homestead in the husband's lands. In most States the husband may acquire curtesy in the wife's real estate, but in some, like New York, the wife may defeat his right by conveyance or will. In some States, as New Jersey, the wife cannot convey her real estate as freely as the husband may, but must be examined apart from her husband by a notary, commissioner, or judge before making the conveyance, who must ascertain whether the conveyance is freely made without coercion by the husband. Estates by the entirety are now generally obsolete, the husband and wife taking as tenants in common where a conveyance is made to them together, but tenancy by entirety is still favored in several of the States. In nearly all jurisdictions statutes of distribution (qv) have been enacted, by which either party to the marriage becomes entitled to a part of the personal property of the other in case of his or her death without having disposed of it by will. In other particulars these statutes follow closely the analogy of the law of inheritance. Provision has also been made by statute in most jurisdictions for directly compelling the husband to support the wife by means of a quasi-criminal proceeding brought at her instance. The same result may be obtained by the various statutory forms of judicial separation (see *DIVORCE*), by which the husband may be compelled to pay the wife certain sums of money as alimony (qv).

The criminal law relating to husband and wife as well as the rules relating to their competency to testify for or against one another in criminal proceedings, remain substantially unchanged. The husband and wife are now generally competent witnesses in all civil actions with the exception of an action for divorce brought by one against the other, in which case neither is allowed in most jurisdictions to testify against the other or to acts of adultery committed by the other, and in no case is either allowed to testify as to any confidential commu-

nication made to or received from the other during coverture. See *MARRIAGE*, *COVERTURE*, *DIVORCE*, *DOMESTIC RELATIONS*.

Scots Law The law of husband and wife in Scotland as regards their personal rights and disabilities, and the property during the marriage, does not substantially differ from the law of England, but the following points may be noticed. As regards their persons and personal rights and crimes the law is the same. It is often said that in Scotland the movable property of both husband and wife becomes a kind of joint-stock property, called *goods in communion*, but this phrase has no meaning except with reference to the division of the property after the death of one of the parties or upon the dissolution of the marriage. The husband is, as in England, entire master, except that he cannot bequeath the entire property away from the wife. The wife's movable property becomes the husband's, and her heritable property remains subject to the husband's life rent. When she disposes of her heritable property, she must ratify the deed by going before a magistrate and acknowledging that she acts of her own free will. When the husband deserts her, she may, as in England, obtain a judge's order to protect her earnings and moneys, and she has a preferable right to a reasonable provision out of any property to which she may succeed (Conjugal Rights Amendment Acts, 1861 and 1874). By the Married Women's Property (Scotland) Act, 1877, the produce of a wife's industry or skill is excluded from the rights of her husband, and his liability for her antenuptial debts is restricted to the amount she brought into the marriage. A wife has in Scotland the power to bind her husband for necessities, but the husband can, by a process of inhibition, give notice to tradesmen not to supply her at his expense, and this notice will be binding on all the King's subjects.

Community Property Occupying an intermediate ground between the common law and the civil law relating to the husband and wife is the law of community property. The notion of a community of interests by husband and wife in all property acquired during the coverture seems to have been derived from the civil law and the mediæval customary law and is now incorporated into the Code Napoléon and most of the other European codes as fixing the rights of husband and wife in the absence of contract. The most important peculiarity of community property is the partnership of husband and wife in all property acquired by them during the coverture, and under some systems in property acquired before the marriage. The husband is the *curator* of the wife, who has no power to contract independently of his authority, but she retains her joint interest in the community property and, after her husband's death, is entitled to one-half the community property, the other half passing to the heirs. The husband has the same right in case of the wife's death. See *COMMUNITY OF PROPERTY*.

For the particular doctrine of community property belonging to the Spanish law and adopted in New Mexico and to some extent in Arizona, California, Nevada, Idaho, Texas, and Washington, see *GANANCIAL SYSTEM*. Consult *The Commentaries of Kent and Blackstone*. Hammick, *Marriage Laws of England* (2d ed., London, 1887), Macqueen, *Rights and Liabilities of Husband and Wife* (4th ed., ib., 1905),

Schouler, *Domestic Relations*, the statutes of the various States in the United States, and the authorities referred to under DOMESTIC RELATIONS

HUSBANDRY, PATRONS OF See GRANGE

HUSBANDS, hūz'bandz, HERMAN (c-1795) An American Revolutionary agitator. He was born in Pennsylvania, but settled in North Carolina and was a member of the Legislature of that Colony. In 1768 he became one of the leaders of the Regulators (qv), an organization formed to redress grievances. After several times coming into conflict with Governor Tryon, at last, in 1771, his force of 2000 Regulators was defeated, and Husbands fled from the Colony, settling near Pittsburgh. He was a member of the Pennsylvania Legislature in 1778 and at the time of the Whisky Insurrection (qv) of 1794 was a member of the Committee of Safety with Albert Gallatin and others.

HUSCHKE, hush'ke, GEORG PHILIPP EDUARD (1801-86). A Prussian jurist, born at Münden and educated at the universities of Göttingen and Berlin. At Göttingen he was made instructor in Roman law (1821). Afterward he was professor of law at Rostock (1824) and at Breslau (1827). He took a prominent part in ecclesiastical politics and was so strong a partisan of the Lutheran communion that his opponents brought an unsuccessful criminal suit against him for inciting an insurrection (1835). In 1838 he was at the head of the court of arbitration at Breslau. Later he held high ecclesiastical offices in the gift of the state and was made Privy Councillor. As a jurist, he combined the historical and philological methods. His more important works are *Studien des römischen Rechts* (1830), *Die Verfassung des Königs Servius Tullius* (1838), *Ueber den Census und die Steuerverfassung der frühern römischen Kaiserzeit* (1847), *Gaius, Beiträge zur Kritik und zum Verständnis seiner Institutionen* (1855), *Jurisprudentiæ Antequintianæ quæ Supersunt* (5th ed, 1886), and the valuable works on the Italian dialects, *Die oskischen und sabellischen Sprachdenkmäler* (1856), *Die Iguvischen Tafeln nebst den kleinern umbrischen Inschriften* (1859); *Zu den altitalienischen Dialecten* (1872), *Die neue oskische Bleitafel* (1880).

HUSEMANN, hūz'e-man, THEODOR (1833-1901). A German pharmacologist, born in Detmold and educated at Göttingen, Würzburg, Berlin, and Prague. He practiced medicine for five years and in 1860 went to Göttingen, where he became docent (1865) and professor (1873) of pharmacology and toxicology. From 1881 to 1883 he was a member of the German Pharmacopœic Commission. He wrote *Handbuch der Toxikologie* (1862-67) and *Die Pflanzenstoffe in chemischer, physiologischer, pharmakologischer und toxikologischer Hinsicht* (1871), both with his cousin AUGUST (1833-77), who was professor at Chur, contributed to Maschka's *Handbuch der gerichtlichen Medizin* (1882) and to the Penzold Stintzang *Handbuch der speziellen Therapie* (1895), and wrote a *Handbuch der gesamten Arzneimittellehre* (3d ed, 1872) and a study on the pharmacopœias of the sixteenth century, *Die kölnischen Pharmakopœen und ihre Verfasser* (1899).

HUSH, hush. See HUSI

HUSH MONEY. In English law, money or other property given or offered to another for the purpose of inducing the latter to refrain

from prosecuting a criminal offense or from giving evidence against a person accused of crime. The giving or offering of hush money is not a penal offense at common law, unless it amounts to subornation of perjury, but the transaction is illegal as being contrary to public policy and morality, and no contract based on an agreement or promise to suppress a criminal prosecution or to conceal crime is enforceable at law or equity. However, a person agreeing for a consideration not to prosecute a felony is guilty of the crime of compounding a felony and may be punished by penal servitude. See COMPOUNDING OF FELONY.

HUSI, hū'sā, Rum pron hūsh, or **HUSH**. The capital of the Rumanian District of Falcu, Moldavia, situated a short distance west of the Pruth and 38 miles south-southeast of Jassy (Map Balkan Peninsula, G 1). It has a fifteenth-century cathedral and a theological seminary. Pop. 1889, 12,660, 1899, 15,484.

HUSKISSON, WILLIAM (1770-1830). An English statesman and financier. He was born at Birch Moreton, Worcestershire, March 11, 1770, and in 1783 was sent to Paris to study medicine. He took part in the storming of the Bastille and as a member of the Club of 1789 delivered before his associates a speech on the currency. After his return to England in 1792 he received a subordinate appointment under the Tory government and formed an intimate acquaintance with Pitt and Canning. As Undersecretary of State for War (1795-1801), he did most of the work of that office. In 1796 he entered Parliament for Morpeth and, with the exception of two years, remained a member for various constituencies to his death. He held several offices under Pitt, with whom he retired in 1801. In 1804 he was appointed Secretary of the Treasury in the new Pitt cabinet, and on Pitt's death in 1806 he lost his office, but was restored to it by Mr Perceval in 1807. In 1814 he was made Chief Commissioner of the Woods and Forests, in 1823 President of the Board of Trade, and in 1827 Secretary of State for the Colonies. Through his exertions the old restrictions on the trade of the Colonies with foreign countries were removed. He also obtained the removal or reduction of many import duties, considerable relaxation of the navigation laws, and is in fact mentioned as the great pioneer of free trade. His death (Sept 15, 1830) was caused by injuries received that day at the opening of the Liverpool and Manchester Railway. Consult *Speeches*, with biographical memoir (3 vols, London, 1831)—from the comprehensive views which they exhibit, as well as from their full and accurate details, these speeches are valuable to students of political economy, Hansard, *Parliamentary Debates* (ib, 1821-28), J Wright, *Life* (ib, 1831), F C Greville, *Memoirs of the Reigns of George IV and William IV* (1st series, New York, 1875).

HUSS, HENRY HOLDEN (1862-) An American composer, born in Newaick, N J. He studied first with his father, George J Huss, and in 1882 entered the Munich Conservatory, Germany, taking up the study of counterpoint, composition, and instrumentation, and the organ under Rheinberger. During his stay in Germany he studied the pianoforte under Giehl and conducting under Abel. In 1885 he became a resident of New York and subsequently became well known throughout the country as a

composer, pianist, and teacher. His compositions include a scena for soprano and orchestra (*Cleopatra's Death*), a concerto for piano a concerto for violin, songs, part songs, and chamber music.

HUSS, or **HUS**, **JOHN** (c 1370–1415). A Bohemian religious reformer. He was born at Husinec (or Husinec), Bohemia, northwest of Budweis. His baptismal name was Jan, from his birthplace he was called Johannes de Husynecz, or, in English, John Huss. The day and year of his birth are unknown. His parents were Czech peasants. He studied at the University of Prague, where he soon made a reputation for scholarship, became M.A. (1396), university lecturer (1398), dean of the philosophical faculty (1401), and was rector in 1402 and 1403. In philosophy he was a realist. He became a priest in 1401. Owing to the marriage in 1382 of Anna, sister of King Wenceslas, to King Richard II of England, there was much intercourse between Bohemia and England. So the writings of the great English theologian, Wiclif (died 1384), came into Bohemia. Huss read them eagerly and availed himself of permission to lecture upon them in the university. He went further and translated them into Bohemian, and the world has given Huss credit for writings which were merely translations from Wiclif. He also defended Wiclif's opinions, not only in the lecture room, but from the pulpit. As he was a very popular preacher in the Bethlehem Chapel in Prague, and confessor to the Queen and a scholar of high repute, this stand attracted wide attention.

Wiclif had, however, not escaped the charge of heresy, and so in 1403 Huss was forbidden by the university authorities to discuss 45 sentences or theses which he had derived mostly from Wiclif, and in 1409, when the Pope, Alexander V, had issued his bull against the teachings of Wiclif and the Archbishop of Prague had burned Wiclif's writings, Huss felt the effect of the opposition he had stirred up on the part of the hierarchy, the priests, and the monks by denouncing, in imitation of Wiclif, the corruption of the Church. In 1410 he and his followers were excommunicated, and in the following year the decree was confirmed by the Pope. Undeterred, he kept on preaching as before. In 1411 Pope John XXIII proclaimed a crusade against King Ladislas of Naples and promised indulgences to the volunteers. Huss the next year gave out a university debate upon the question of indulgences, which only widened the breach between himself and the university authorities and the clergy. In 1412 a papal interdiction was issued against him. In reply he wrote his book *On the Church*, again drawing heavily from Wiclif, and appealed from the Pope to a general council and to Christ, and then, feeling no longer safe in Prague, he withdrew to the castles of certain friendly noblemen. In 1414, obedient to a summons, but under the protection of King Wenceslas, who had continually befriended him, and with a safe-conduct to go to Constance, given by the Emperor Sigismund, he went to the general council which had been convened in Constance.

His journey thither was a triumph, and he entered the city (November 3) in great state. At first he was a free man, but on November 28 he was apprehended and charged with having made an attempt to leave the city, and cast into prison, in spite of the indignant protests of the

Bohemian and Polish nobles. He may have fancied that he would have opportunity to defend his views in open debate, but he quickly learned that the council intended to try him as a heretic. He was, however, long kept in suspense, for it was not till June 5, 1415, that he was first formally accused. On June 8, 39 charges were exhibited against him, some of which he acknowledged as fairly based upon his teachings, while others he declared to be misrepresentations. Being required to recant his alleged errors he refused to do so until they should be proved to be errors and claimed that he had not departed from Catholic doctrine, though he expressed admiration for Wiclif. On June 18 the articles of his condemnation were prepared, on June 24 his books were burned, on July 1 his attempts to come to an understanding with his prosecutors failed, and on Saturday, July 6, he was condemned to be burned at the stake for heresy. The same day the sentence was executed, and the martyr's ashes were thrown into the Rhine. The Emperor, though present, did not interfere, since heretics had no claim to protection. The death of Huss caused sorrow and indignation throughout Bohemia and led to the so-called Hussite War. See **HUSSITES**.

A critical edition of Huss's writings, distinguishing between his own works and his translations from Wiclif, is lacking. The best we have is F. Palacký's *Documenta Magistri Joannis Hus* (Prague, 1869). The works of Huss in Bohemian were published by K. J. Eiben (Prague, 1865–68). E. de Bonnechese published a French translation of his letters (Paris, 1846), from which an English translation was made (London, 1846). F. B. Mikowec prepared one in German (Leipzig, 1869). Nowotny began a German translation of his sermons (Görlitz, 1855). For his biography, consult E. H. Gillett (Boston, 1863–64), A. H. Wratislaw (London, 1882), F. H. H. Lutzow, *Life and Times of Master John Hus* (New York, 1909), for his relations to Wiclif, Loserth, *Wiclif and Huss* (trans., 1b, 1884), H. C. Lea, *History of the Inquisition*, vol. viii (1b, 1888). See references of **CONSTANCE**, **COUNCIL OF**.

HUSSARS, húsz-zász. Light cavalry. Originally a distinct type of Hungarian mounted troops, receiving their name, it is said, from the circumstance of their origin, Matthias Corvinus having in 1458 raised a body of cavalry to operate against the Turks by taking one man out of every 20 inhabitants, hence the use of the word "husz-ár," in Hungarian, *the twentieth*. The demand for cavalry possessing greater mobility than the dragoons, as yet the only type, led to the formation of light-cavalry regiments on the hussar model. Nearly two-thirds of the entire cavalry strength of Great Britain consists of hussar and lancer regiments, the general proportion throughout Europe being almost as great. The original Hungarian hussars had several peculiarities of dress and equipment, the most conspicuous of the former being a loose jacket suspended in part from the shoulders—a feature still preserved in several countries. See **CAVALRY**.

HUSSEIN AVNI PASHA, hus-sân' av-né pa-sha' (1819–76). A Turkish general and statesman, born at Dost-Koç, near Isparta, in western Asia Minor, and educated after his sixteenth year in Constantinople. In 1853 he entered the general staff under Omar Pasha, with the rank of lieutenant colonel, and with him di-

rected the fortification of the Balkan passes. He commanded a division in the war with Montenegro (1859-60), became general in chief of the guard (1864), and in 1867-69 put down the rising in Crete. As a reward for this service, he was made Minister of War, from which post he was retired in 1871, after the death of Ali Pasha, his protector. In 1872, on the accession of Midhat Pasha to the grand-viziership, he returned to Constantinople from his exile at Isparta, became Grand Vizier in 1874, and Governor of Smyrna in 1875. In the same year, after a journey through France and England, he was again Minister of War for six weeks, and in May, 1876, was a leader in the plot which deposed Abdul Aziz and put Amurath V on the throne. Less than a month later he was assassinated by an officer, Hassan Bey, at a ministerial meeting.

HUSSEIN KEMAL (kə-mal') **PASHA**, PRINCE (c1850-) The first Sultan of Egypt after the declaration (December, 1914) of a British protectorate over that country. A son of Ismail Pasha (qv), Viceroy from 1863 to 1879, and eldest living prince of the family of Mehemet Ali (qv), he succeeded his nephew, Abbas Hilmi, who was deposed by the British because he had sided with Turkey in the European War. (See WAR IN EUROPE.) Hussein Kemal was unusually well educated, in Egypt and in Paris, where he was intimate in Napoleon III's family. He left the capital upon the overthrow of the monarchy (1870) and afterward held a number of posts in Egypt—Inspector of Upper and Lower Egypt, Minister of Public Instruction, of Public Works, of the Interior, of War, and of Finance. Thus especially fitted by varied service, he was installed as Khedive, with the title of Sultan, Dec 19, 1914.

HUSSEIN NAZIM PASHA, hus-sān' na'-zem pa-sha' (1848-1913). A Turkish soldier and public official, born at Constantinople. He completed his military education at Saint-Cyr, Paris, and during the Russo-Turkish War rose to chief of staff. While in prison for a five-year term because of his political activities, he continued his studies of military science, and when he finally escaped he hastened to join the Young Turks in the revolution of 1908. He was appointed to the command of the Second Army Corps at Adrianople, where he greatly strengthened the fortifications. In 1909 he became Minister of War under Kiamil Pasha, but, having antagonized the Young Turks, soon gave up the office. Later, as Governor-General (vali) at Bagdad, he accomplished important reforms and improved public property. In 1911 he was appointed president of the army council and in 1912 Minister of War in the cabinet of Mukhtar Pasha. After the defeat of Lule Burgas he commanded the Turkish forces in person, conducting the defense along the Tchatalja lines with great energy. (See BALKAN WAR.) He was assassinated by the Young Turk conspirators in the coup d'état of 1913.

HUS/SITES. The followers of John Huss (qv). Honoring him as a martyr, about 450 Bohemian nobles formed a league, protesting against the action of the Council of Constance which had condemned Huss to be burned and bidding defiance to decrees of bishops and the Pope. The symbol of their confederacy was the cup, the use of which in the Lord's Supper they extended to the laity, as had already been done with the approbation of Huss. King Wenceslas

of Bohemia was constrained to grant them the use of many churches. After his death (August, 1419) the majority refused to recognize as King his brother, the Emperor Sigismund (qv), who had broken his safe-conduct given to Huss. The so-called Hussite war was followed. For eight years (1420-27) the Hussites, led by their generals Ziska (qv) and Procopius (qv), were victorious against the forces sent against them by the Emperor and the Pope, and in 1429 and 1430 they carried terror into the countries of Germany bordering on Bohemia. Convents and churches were reduced to ashes, and priests and monks were slain. From the beginning the Hussites had included two parties—the more conservative, called Calixtines (qv), or Utraquists, from their use of the cup in the Lord's Supper, who were more in sympathy with the Church and hoped for an ultimate reconciliation, and the radical, called Taborites (qv), who went much further in rejecting doctrines and practices of the Church. A third faction, intermediate between the two, called Orphans, also developed. In 1431 the Council of Basel (qv) undertook to conciliate the Hussites and succeeded in coming to an agreement with the Calixtines by the "Compactata of Prague," signed in 1436, after which the latter acknowledged Sigismund as King and made peace with the Church. The Taborites and Orphans were completely defeated in a battle near Bohmischbrod, May 30, 1434, and soon disappeared as a political power, but continued to exist as the Bohemian Brethren (qv). Consult Ernest Denis, *Huss et la guerre des Hussites* (Paris, 1878), and Lutzow, *Bohemia* (London, 1896).

HUSTINGS (AS *hūsting*, from Icel *húsping*, council place, from *hūs*, AS, OHG *hūs*, Ger. *Haus*, house + *ping*, thing, assembly, OHG *ding*, Ger. *Ding*, thing, connected with Goth *þeihs*, Lat. *tempus*, time). An English term applied to the place or platform where, before 1872, members of Parliament were nominated for election, or from which a candidate addressed his constituents. The term is still applied to any electioneering platform. A court of hustings formerly existed in many English cities for the trial of suits brought for the recovery of land situated within the city limits. Such a court still survives in London, but its authority, which at one time extended to all actions between citizens, has now practically disappeared. The hustings court existed in the towns of Virginia founded during the eighteenth century. Thus, the charter of Norfolk Borough, incorporated in 1736, established a hustings court to be held once a month, with jurisdiction over actions of ejectment, trespass, and writs of dower, as well as all other actions, personal and mixed, involving not more than £20. A hustings court is still one of the municipal tribunals of Richmond. It is held by a judge elected in the same manner as the circuit judges and has original and exclusive jurisdiction of most criminal offenses committed within the city limits.

HUTCHESON, FRANCIS (1694-1746). A moralist of the eighteenth century, born Aug. 8, 1694, in County Down, Ireland. His father was a Presbyterian minister. He studied for the Church at the University of Glasgow, but after a short term of preaching he was induced, in 1719, to open a private academy in the city of Dublin, which proved highly successful. In 1725 he published his *Inquiry into the Original of our Ideas of Beauty and Virtue*, etc.,

which was the means of introducing him to the notice of many influential personages, such as Archbishops King and Boulter, and Lord Granville, then Lord Lieutenant of Ireland. This work was followed, in 1728, by his *Essay on the Nature and Conduct of the Passions and Affections*, and in the year after he was appointed professor of moral philosophy in the University of Glasgow. Here he died, in 1746. His largest and most important work, *A System of Moral Philosophy*, was published at Glasgow in 1755 by his son, Francis Hutcheson. From the period of Hutcheson's lectures, according to Dugald Stewart, may be dated the metaphysical philosophy of Scotland. But it is as a moral philosopher, rather than as a metaphysician, that Hutcheson is noteworthy. His system is, to a large extent, that of Shaftesbury, but it is more complete, coherent, and clearly illustrated. Hutcheson emphasized the importance of "calm benevolence" and was a strong opponent of the doctrine that it has a selfish origin. Equally important with benevolence in his system is the moral sense, "which does not impel towards good actions, but merely judges the moral quality of actions and gives its approval to benevolence." The latter is the mainspring of good conduct. All action prompted by benevolence is formally good, but to be materially good it must be an action which "procures the greatest happiness for the greatest numbers." In this respect he was a forerunner of the English utilitarians. Consult Thomas Fowler, *Shaftesbury and Hutcheson* (London, 1882), James Maitnean, *Types of Ethical Theory* (Oxford, 1886), W. R. Scott, *Francis Hutcheson* (New York, 1901), Ernest Albee, *History of English Utilitarianism* (ib., 1902).

HUTCHINS, HARRY BURNS (1847-) An American university president, born at Lisbon, N. H. In 1871 he graduated from the University of Michigan, where he was instructor and assistant professor of history and rhetoric (1872-76), Jay professor of law (1884-87), professor of law and dean of the department of law (1895-1910), acting president (1897-98 and 1909-10), and president after 1910. He served as professor of law at Cornell University in 1887-94. In 1882-83 he revised and annotated the *Michigan Supreme Court Reports* (5 vols.), edited the American edition of *Williams on Real Property*, and is author of a biography of Thomas M. Cooley in the *Great American Lawyers Series*.

HUTCHINS, THOMAS (1730-89) An American geographer. He was born in Monmouth Co., N. J., entered the British army at an early age, and participated in the French and Indian War. Being in London in 1779, he was imprisoned on suspicion of favoring American independence, but he escaped by way of France, went to Charleston, S. C., entered the Continental army, and was appointed geographer general by General Greene. He was the author of several geographical works, including the important *Topographical Description of Virginia, Pennsylvania, Maryland, and North Carolina* (1778), printed, with biographical and bibliographical matter by F. C. Hicks, Cleveland, 1904) and *History, Narrative and Topographical Description of Louisiana and West Florida* (1784). He lived for several years in Louisiana, and this latter volume is valuable for the reports of the last years of Spanish régime in the vicinity.

HUTCHINSON A city and the county seat

of Reno Co., Kans., 219 miles by rail west of Kansas City, Mo., on the Arkansas River, and on the Atchison, Topeka, and Santa Fe, the Chicago, Rock Island, and Pacific, and the Missouri Pacific railroads (Map Kansas, D 6). It is in the fertile Arkansas valley, has an extensive trade in grain, and is a jobbing centre for a wide territory, having several wholesale houses. There are important manufactures of salt, soda ash, and straw board, and large flouring mills. Hutchinson is a popular city for conventions, is the home of the Kansas State Fair, and among the features of the city are Convention Hall, Glendale and Northside parks, the State Industrial Reformatory, the grounds of which cover 640 acres, and the courthouse and public-library buildings. Founded in 1871, Hutchinson was incorporated two years later, and in 1909 adopted the commission form of government. Pop., 1900, 9379; 1910, 16,364; 1914 (U. S. est.), 19,339.

HUTCHINSON, ANNE (c. 1590-1643) A religious enthusiast, of American celebrity, born in Lincolnshire, England, 1590 or 1591. She was a daughter of Rev. Francis Marbury, married William Hutchinson, 1612, and emigrated to Boston, Mass., in 1634. Living in a community prone to religious excitement, she claimed to be a medium of divine revelation and held meetings for women and later for both sexes, in which she set forth the doctrine that those who were in the covenant of grace were not under the covenant of works. This was considered as Antinomian by the state clergy and likely to have sad practical consequences. Great controversies arose, and a synod was called, in which her teachings were condemned, and she was banished from the Colony. She and her friends now obtained from the chief of the Narraganset Indians liberty to reside in Rhode Island, where they purchased the island of Aquidneck and set up a community on the highly commendable principle that no one was to be "accounted a delinquent for doctrine" (1638), calling the name of the town Portsmouth. After the death of her husband (who shared her opinions), in 1642, she removed to the west of Stamford, Conn., which was then Dutch territory, and there in September, 1643, she and her whole family of 15 persons were taken prisoners by the Indians, and all but one daughter murdered. She seems to have been a woman of extraordinary ability and independence of thought, against whom the most serious charge was that her teachings might produce harm in others. Consult Jared Sparks, "Anne Hutchinson," in *Library of American Biography*, vol. xvi (2d series, Boston, 1845), and C. F. Adams, *Three Episodes in Massachusetts History* (2 vols., Boston, 1893).

HUTCHINSON, JOHN HELY- and **SIR WALTER F. HELY-** See HELY-HUTCHINSON.

HUTCHINSON, JOHN (1615-64) An English regicide, born in Nottingham and educated at Cambridge. After a short study of the law at Lincoln's Inn, he identified himself with the Parliamentary side in the struggle against the King, became a member of the committee for Nottinghamshire, and throughout 1644 and 1645 acted as Governor of both Nottingham and Nottingham Castle, successfully holding them against repeated Royalist attacks, attempted bribery, and internal dissensions. In 1646 he succeeded his father, Sir Thomas Hutchinson, as a member of the Long Parliament, and two years afterward he sat as one of the King's judges and

signed the royal death warrant. He served under Cromwell in the Council of State until 1653, when he retired from politics and refused further office under the Protector. He seems to have worked for a restoration of the Long Parliament, and during its short session, from May to October, 1659, he returned to his seat. He was a member from Nottingham to the Convention Parliament in 1660, but was immediately expelled as a regicide, though his life was spared through the intercession of relatives. In 1663 he was arrested as an accessory to the Yorkshire Plot and, despite meagreness of evidence against him, was imprisoned in the Tower. In May, 1664, he was removed to Sandown Castle in Kent, where he died from fever in the following September. Hutchinson represented the nobler type of Puritanism. His wife Lucy (1620-c 1680) was very influential in saving his life when the Restoration took place, and after his death wrote his life. Consult Lucy Hutchinson, *Memoirs of the Life of Colonel Hutchinson, to which are Added the Letters and Other Papers*, revised by C. H. Firth (2 vols, London, 1885), and C. H. Firth, in *Dictionary of National Biography*, vol. xxviii (1b, 1891).

HUTCHINSON, JOHN (1674-1737) An English theological writer. He was born at Spennorthorne, near Middleham, in Yorkshire. For some time he was steward of the household of the Duke of Somerset and left his service to devote himself to religious studies, the Duke procuring for him a sinecure appointment from the government. In 1724 he published the first part of a work called *Moses' Principia*, in which he defended what he regarded as the Mosaic cosmogony and assailed Newton's theory of gravitation. He continued to publish a succession of works till his death, in London, Aug. 28, 1737. The leading principle of his system is that the Holy Scriptures contain the elements not only of true religion but of all rational philosophy, which, however, was to be derived only from the original unpointed Hebrew text, which he subjected to strange fanciful processes. His works at one time exercised a considerable influence, and his followers, called Hutchinsonians, included some persons of considerable learning and celebrity. His works appeared in 12 volumes (London, 1748), with life by Spearman in supplement (1b, 1765).

HUTCHINSON, JOHN IRWIN (1867-) An American mathematician, born at Bangor, Me. He was educated at Bates College, Lewiston, Me. (A.B., 1889), at Clark University (1890-92), and at the University of Chicago (Ph.D., 1896). At Cornell University he was instructor in mathematics from 1894 to 1902, assistant professor in 1903-09, and professor after 1910. He is coauthor with Virgil Synder of *Differential and Integral Calculus* (1902) and *Elementary Treatise on the Calculus* (1912). He published also reviews chiefly on hyperelliptic, theta, and automorphic functions, on algebraic surfaces, and on birational transformations.

HUTCHINSON, SIR JONATHAN (1828-1913) An English surgeon, born at Selby, Yorkshire. He received his training at St. Bartholomew's Hospital (1850-54). At the Royal College of Surgeons he was professor of surgery and pathology in 1877-82 and president in 1889-90, and he was president of the Hunterian (1869-70), Pathological (1879-80), Ophthalmological (1883), Neurological (1887), Medical (1890), and Royal Medical and Chirurgical (1894-96)

societies, and was a member of royal commissions on smallpox hospitals (1884) and vaccination (1890-96). He announced in 1862 his discovery that a certain form of eye disease in children was due to hereditary syphilis. He is also known for his researches on leprosy and for his association of that disease with the eating of salt fish. He edited the *Archives of Surgery* and published *Syphilis* (1887, new ed., 1910) and *On Leprosy and Fish-Eating* (1906).

HUTCHINSON, THOMAS (1711-80) An American Loyalist, the last royal Governor of the Province of Massachusetts Bay. He was born Sept. 9, 1711, in Boston, where his father, the great-grandson of Anne Hutchinson (qv), was a wealthy merchant and shipowner. He graduated at Harvard in 1727, entered his father's countingroom, early showed remarkable aptitude for business, and by the time he was 24 had accumulated considerable property in trading ventures on his own account. The social prominence of his family, as well as his own position in the business world, made him, while still a young man, a person of considerable importance in the community. In 1737 he was elected a member of the Boston board of selectmen. Later in the same year he was chosen a representative to the General Court of the Colony and at once took a strong stand in opposition to the views of the majority with regard to a proper currency. His proposal to borrow silver in England to redeem the outstanding bills of credit and his opposition to the revival of the land bank made him unpopular with the people and impelled his constituents in town meeting to draw up "instructions," disregard of which led to his retirement in 1740. In that year he went to England as a commissioner to represent Massachusetts in a boundary dispute with New Hampshire. In 1742 he was reelected to the General Court and was thereafter chosen annually until 1749, serving as Speaker from 1746 to 1749. He continued his advocacy of a sound currency, and when the British Parliament reimbursed Massachusetts in 1749 for the expenses incurred in the Louisburg expedition, he proposed the abolition of the bills of credit, and the utilization of the parliamentary repayment as the basis for a new Colonial currency. The proposal was finally adopted by the Assembly, and its good effect on the trade of the Colony at once established Hutchinson's reputation as a financier. On leaving the General Court he was appointed at once to the Governor's Council, in 1750 he was chairman of a commission to arrange a treaty with the Indians in the District of Maine, and he served on boundary commissions to settle disputes with Connecticut and Rhode Island. In 1752 he was appointed judge of probate and a justice of the Common Pleas. In 1754, as a delegate from Massachusetts to the Albany Convention (qv), he took a leading part in the discussions, and favored Franklin's plan for Colonial union, although doubting its practicability. In 1758 he was appointed Lieutenant Governor, and in 1760 Chief Justice, of the Province. In the following year, by issuing writs of assistance (qv), he brought upon himself a storm of protest and criticism. His distrust of popular government as exemplified in the New England town meeting increased. Although he opposed the principle of the Stamp Act (qv.), considered it impolitic, and later advised its repeal, he accepted its legality, and, as a result of his stand, his city house was

sacked by a mob in August, 1765, and his valuable collection of books and manuscripts destroyed. In 1769, upon the resignation of Governor Bernard, he became acting Governor, serving in that capacity at the time of the Boston Massacre (qv), March 5, 1770, when popular clamor compelled him to order the removal of the troops from the city. In March, 1771, he received his commission as Governor. His administration, controlled completely by the British ministry, increased the friction with the patriots. The publication, in 1773, of some letters on Colonial affairs written by Hutchinson, and obtained by Franklin in England, still further aroused public indignation, and led the ministry to see the necessity for stronger measures. The temporary suspension of the civil government followed, and General Gage was appointed military governor in April, 1774. Driven from the country by threats in the following May and broken in health and spirit, Hutchinson spent the remainder of his life an exile in England. There, still nominally Governor, he was consulted by Lord North in regard to American affairs, but his advice that a moderate policy be adopted, and his opposition to the Boston Port Bill, and the suspension of the Massachusetts constitution, were not heeded. His American estates were confiscated, and he was compelled to refuse a baronetcy on account of lack of means. He died at Brompton, now a part of London, June 3, 1780. He wrote a *History of Massachusetts Bay* (vol. 1, 1764, vol. 11, 1767; vol. 111, 1828), a work of great historical value, calm, and judicious in the main, but entirely unphilosophical and lacking in style. His *Diary and Letters* was published in 1884-86. Consult J. K. Hosmer, *Life of Thomas Hutchinson* (Boston, 1896), and the chapter "Thomas Hutchinson, the Last Royal Governor of Massachusetts," in John Fiske, *Essays, Historical and Literary*, vol. 1 (New York, 1902).

HUTCHINSON, THOMAS JOSEPH (1820-85). A British explorer, born at Stonyford, Ireland. He studied medicine and, after a trip to West Africa in 1851, was chief surgeon on the Niger expedition (1854-55). After two years as English Consul at the Bight of Biafra and Fernando Po, he became Governor of the latter place (1857) and in 1861 was transferred to the consulate at Rosario in Argentina, where a year later he took part in the Salado expedition. In 1870 he was appointed Consul at Callao and three years later retired to his Irish property. He wrote *Narrative of the Niger Tshadda Binue Exploration* (1855), *Impressions of Western Africa* (1858), *Ten Years' Wandering among the Ethiopians* (1861), *Buenos Ayres and Argentine Gleanings* (1865), *Parana and South American Recollections* (1868), *Two Years in Peru* (1874), *Summer Rambles in Brittany* (1876).

HUTCHINSON, Woods (1862-) An American physician, born at Selby, Yorkshire, England. He graduated from Penn College, Oskaloosa, Iowa, in 1880 and (M.D.) from the University of Michigan in 1884, was professor of anatomy at the State University of Iowa (1891-96), professor of comparative pathology at the University of Buffalo (1896-1900), and State health officer of Oregon (1903-05), and lectured at the London Medical Graduates' College and the University of London in 1899-1900. In 1905 he became professor of clinical medicine at the New York Polyclinic. He edited

Fis Medicatrix (1890-91) and *The Polyclinic* (1899-1900), and is author of *The Gospel According to Darwin* (1898), *Studies in Human and Comparative Pathology* (1901), *Instinct and Health* (1908), *Preventable Diseases* (1909), *Conquest of Consumption* (1910), *Exercise and Health* (1911), *The Child's Day* (1912), *Common Diseases* (1913), *Civilization and Health* (1914).

HUTCHINSONIANS. See HUTCHINSON, JOHN (1674-1737).

HUTCHINSON, JOHN (1832-1910). A Scottish sculptor, born in Edinburgh. He began there as a wood carver, but attended the art school at the same time, and in 1860 and 1863 studied at Rome. He first exhibited in 1856 at the Royal Scottish Academy, of which he became member in 1867, librarian in 1877, and treasurer in 1886. Apart from ideal subjects in marble and bronze, such as "Hamlet," "Don Quixote," and "Dante," he modeled statues of Robert Bruce, John Knox (a colossal bronze in Edinburgh), George Buchanan, Regent Murray, "Hal-o'-the-Wynd," "Floira Mac Ivoi" for the Scott monument in Edinburgh, and busts of Harold Hardrada, Norman McLeod, Queen Victoria (by command), the Prince Consort, and many other distinguished personages. In the National Gallery at Edinburgh are the busts of Robert Scott Lauder, R.A., "Pasquicia, a Roman Contadina," and "Marietta, a Roman Girl."

HUTH, HUTH, HENRY (1815-78). An English merchant and bibliophile, born in London. He was educated in the classics and also in Persian, Arabic, and Hindustani. He entered his father's business in 1833, but later traveled in Germany, France, the United States, and Mexico, and in 1849 rejoined his father's firm. He collected a large library, containing very many rare books, of which a catalogue was published in 1880.—His son, ALFRED HENRY HUTH (1850-1910), inherited his father's library, to which he added largely. He also wrote a biography of his father's friend, Henry Thomas Buckle, and *Marriage of Near Kin* (1875). The library was sold at auction after A. H. Huth's death.

HUTIA, ḥṭ-tā (Sp, from the native name). A West Indian rodent or hog rat, of the family Octodontidae, differing from rats in having four grinders on each side in each jaw, with flat crowns. The tail is round and slightly hairy and is used for support in sitting erect, as by kangaroos, and for aid in climbing trees. They make much use of their forepaws as hands. They are closely allied to the coypu (qv), but are not aquatic and make their home in the woods. The best-known species is the hutia-couga (*Capromys pilorides*), of Cuba, which is about 22 inches long to the root of the tail. The fur is long, coarse, and yellowish brown, with the paws and ears blackish. Another Cuban species is the hutia-carabali (*Capromys prehensilis*), the tip of whose tail is prehensile. The hutia-couga is a skillful climber and lives in dense forests. Its food is chiefly fruits, leaves and bark, but it also eats the flesh of small animals, particularly that of a kind of lizard. It is easily tamed, and the Cubans consider its flesh a delicacy, for which reason it is much hunted by the natives. The smaller hutia-carabali is said to live chiefly in the tops of trees.

Jamaica has a short-tailed hutia (*Capromys brachyurus*) (see Plate of CAVIES, ETC.), locally called coney, which has become rare, and Ingham's hutia (*Capromys ingrahami*) inhabits

the Bahamas Consult Poey, *Memorias* (Havana, 1860-62)

HUTSCHENRUIJTER, hüt's-en-rí'tër, WOUTER (1859-) A Dutch composer and conductor, born in Rotterdam Having completed his musical education entirely under local teachers, he began his career as conductor of a choral society, at the same time teaching also at the conservatory In 1890 he was called to Amsterdam as second conductor of the famous Concertgebouw Orchestra This post he soon resigned to accept the conductorship of the Utrecht Orchestra By encouraging the younger Dutch composers in producing their works he exercised a strong and wide-felt influence on the musical life of Holland His own works for orchestra and chamber music are highly esteemed by his compatriots He also made a reputation as a writer through his biographies of R. Strauss (1898) and Weingartner (1906) and through an authoritative history of the orchestra, *Orkest en Orkestspeel na 1600* (1903)

HUTTEN, hut'ten, PHILIP VON (c1515-46). A German adventurer and relative of Ulrich von Hutten (q.v.) He was one of the 600 adventurers collected from all parts of Europe who went out under George Hohermuth (better known as George of Speyer) to conquer the Province of Venezuela, which had been granted by Emperor Charles V to the great Augsburg family of Welser (q.v.) When Hohermuth died, in 1540, Hutten became captain general, and the next year, in company with young Bartholomaeus Welser, eldest son of the head of the family, left Coro with a well-equipped force to seek the mythical El Dorado (q.v.) After wandering about for five years, the remnant of the expedition returned to Venezuela to find a new Governor in power Juan de Caravajal had been appointed by the Audiencia of Santo Domingo to preserve order in Venezuela, but, as the years went by with no news of Hutten and his followers, he began to feel secure in his position Consequently the return of the adventurers was anything but welcome to him When he saw how diminished they were in number, he thought to force from them an acknowledgment of his authority In this, however, he was unsuccessful, as he also was in an attempt to seize them In fact this last effort was well-nigh disastrous to himself, for he was wounded by Welser and forced to pledge the Germans safe passage to the coast Relying upon Caravajal's word of honor, the adventurers took no precautions against attack and were easily captured by the treacherous Spaniard, who, after keeping Hutten and Welser in chains for a time, had them beheaded Hutten seems to have been a man of higher character than most of those with whom he was associated He left a narrative of his adventures entitled *Zeitung aus Indien* (1785)

HUTTEN, hut'ten, ULRICH VON (1488-1523). A scholar, poet, and reformer of the German Renaissance, one of the most celebrated of the humanists He was descended from an ancient and noble family and was born at the castle of Steckelberg in Hesse, April 21 1488 At the age of 10 he was placed in the neighboring monastery of Fulda, but, disliking this mode of life, fled in 1605 to Cologne, where he met Hoogstraten Johannes Rhegius, and other scholars of the day In 1506 he came to Erfurt, but soon after rejoined Rhegius at Frankfurt-on-the-Oder, when the new university was opened there There he took his master's degree and

published his first poem In 1507 he followed Rhegius to Leipzig He was stricken down with the pestilence in the following year, but recovered, and at Wittenberg in 1511 published his *115 Versificatoria* During these years he led the life of a wandering poet, subsisting on the bounty of those who admired his talents or feared his mordant wit In 1512 he went to Pavia to study law He had been there only a short time when the city was plundered by the Swiss, and Hutten was deprived of all he possessed For a short time he served as a soldier in the Imperial army, but soon returned to Germany, where he boldly entered into a quarrel with the Duke of Württemberg, who had murdered a kinsman of Ulrich's, and brought about the Duke's punishment In the dispute between Reuchlin (q.v.) and the Dominicans Hutten came to the support of the former and displayed no small learning and great power of satire He went again to Italy in 1515, to take the degree of LL.D. and returned to his native country in 1517. He was crowned with the poet's laurel crown at Augsburg by the Emperor Maximilian, who conferred on him the honor of knighthood in this same year While in Italy, Hutten had become imbued with a fierce hatred for the papacy, which he bitterly attacked in his preface to an edition of Laurentius Valla's *De Donatone Constantini*, published in 1517 In the following year he accompanied his patron, Albert, Archbishop of Mainz, to the Diet of Augsburg, where Luther had his famous conference with Cajetan Subsequently he established a small printing press of his own and employed himself in putting forth pamphlets written in the German language violently attacking the Pope and the Roman clergy The Archbishop Albert denounced him at Rome, whereupon Hutten took sides with Luther, whom he had hitherto affected to despise Persecuted by his enemies, he availed himself of the protection of Franz von Sickingen, but was forced to flee from the latter's castle after a two years' residence (1520-22) Going to Basel, he was coldly received by Erasmus, who did not approve of his extreme measures, and a breach took place between the two men, culminating in a great literary quarrel which marred their subsequent lives From this time Hutten was compelled to adopt a wandering life He died Aug 23, 1523, on the island of Ufnau in the Lake of Zurich, where Zwingli had secured a living for him Hutten was more open in the expression of his opinions than any other man, probably, of his age. He did much to prepare the way for the Reformation and to promote it He was a master of the Latin language and excelled in satirical and passionate invective His literary life is generally divided into three periods (1) period of Latin poems (1509-16), (2) period of letters and orations (1515-17), (3) period of dialogues and letters in Latin and German (1517-23) In all he published some 45 different works, but his most noteworthy contribution to literature was his portion of the second part of the immortal *Epistolæ Obscurorum Virorum* (q.v.) Hutten's collected works, *Opera Omnia*, were published at Leipzig in seven volumes (1859-70) under the editorship of Bocking

Bibliography Among several biographies by German authors that by D. F. Strauss (6th ed., Bonn, 1895), abridged in English by Sturge (London, 1874), is especially to be recommended Consult monographs by Reichenbach (Leipzig,

1877), Schall (Halle, 1890), Szamatólski, *Ulrich von Hutten's deutsche Schriften* (Strassburg, 1891). A good brief sketch in English is D S Jordan, *Ulrich von Hutten, Knight of the Order of Poets* (Boston, 1910).

HUTTEN ZUM STOLZENBERG, tsumshōtō'sen-bēik, BARONESS VON (BETTINA VON HUTTEN) (1874-) An American novelist, daughter of John Riddle, of Erie, Pa. In 1897 she married Baron von Hutten, chamberlain of the King of Bavaria, but was divorced in 1909. She resided much abroad and traveled widely. *Pam* (1905), with the other novels in which the heroine of this book reappears, has perhaps most strongly commended Baroness von Hutten as a writer. In addition to *Pam*, her novels include *Violett* (1904), *Araley* (1904), *Pam Decides* (1906), *The One Way Out* (1906), *The Halo* (1907), *Beechy, or the Lordship of Love* (1909), *Kingsmead* (1909), *The Green Patch* (1910), *Sharrow* (1912), *Maria* (1914).

HUTTER, hüt'tēr, LEONARD (1563-1616). A German Lutheran theologian, born at Nellingen, near Ulm. He studied at the universities of Strassburg, Leipzig, Heidelberg, and Jena, and after lecturing at Jena for several years went to Wittenberg. He was one of the most resolute and influential representatives of the Lutheran faith and was known as Redonatus Lutherus. He attacked the Calvinist doctrines in his *Concordia Concors* (1614), which he wrote as an answer to Hospinian's *Concordia Discors* (1607).

HUTTON, hū't'n, ARTHUR WOLLASTON (1848-1912). An English clergyman, born at Spridlington and educated at Cheltenham College and at Exeter College, Oxford. He was rector in his native town in 1873-76, was then received into the Roman Catholic church by Cardinal Newman, but in 1898 returned to the Anglican church. He was a member of Newman's Oratorian Community in 1883 and from 1887 to 1899 was librarian of the National Liberal Club. He visited the United States and Canada in 1907-08. His writings include *Our Position as Catholics in the Church of England* (1872), a life of *Cardinal Manning* (1892), *Letters to Mr Asquith and Mr Balfour* (1894-95), *Ecclesia Discens* (1904).

HUTTON, CHARLES (1737-1823). A self-educated English mathematician, born at Newcastle-on-Tyne, of humble parentage. He received most of his education in a school at Jesmond, where at the age of 18 he became master. The number of pupils having increased, he in 1760 opened a mathematical school in Newcastle and also taught mathematics at the Head School of the city. Among his pupils was John Scott, afterward Lord Eldon, Chancellor of England. Hutton also worked as a surveyor, and in 1770 he was engaged by the city of Newcastle to draw up an accurate map of the city and the suburbs. He became professor of mathematics in the Royal Military Academy at Woolwich (1773) and the following year was made a fellow of the Royal Society. He made important contributions to the *Philosophical Transactions*, and in 1778 gained the Copley medal for his papers on "Force of Exploded Gunpowder" and "Velocities of Balls." He was appointed by the Royal Society to determine the mean density and mass of the earth. His report appeared in the *Philosophical Transactions* for 1778. In 1779 he was made foreign secretary of the Royal Society, but resigned in 1783. Owing to failing health, he resigned his professorship in 1807 and

was granted a pension of £500 a year. He was editor of the *Ladies' Diary* from 1774 to 1817. The most important of his works are, besides those mentioned above *The Diarian Miscellany* (1775), *Mathematical Tables* (1785), *Mathematical and Philosophical Dictionary* (1795), *A Course of Mathematics* (1798 and subsequent editions), *Recreations in Mathematics and Natural Philosophy* (4 vols, 1803), from the French of Montucla, "On Cubic Equations and Infinite Series," in the *Philosophical Transactions* for 1780.

HUTTON, EDWARD (1875-) An English writer, especially on Italy. He was born in London and was educated at Highgate School and at Blundell's. He early devoted himself to Italian literature, history, and art, and traveled on foot in Italy and Spain. Hutton edited Denistoun's *Dukes of Urbino* (1908) and Crowe and Cavalcaselle's *Painting in Italy* (1908-09). Among his own valuable writings are *The Cities of Umbria* (1905), *The Cities of Spain* (1906), *Sigismondo Malatesta* (1906), *Florence and Northern Tuscany* (1907), *In Unknown Tuscany* (1909), *Boccaccio* (1909), *Rome* (1909), *Siena and Southern Tuscany* (1910), *Perugia* (1911), *Venice and Venetia* (1911), *The Cities of Lombardy* (1912), *Highways and Byways in Somerset* (1913), *Ravenna* (1913), *The Cities of Romagna and the Marches* (1913), *England of my Heart* (4 vols, vol 1, *Spring*, 1914).

HUTTON, FREDERICK REMSEN (1853-) An American mechanical engineer, born in New York City. He graduated from Columbia College in 1873 and in 1876 from the Columbia School of Mines, where he became assistant and where he was professor of mechanical engineering from 1891 until his retirement in 1907. From 1899 to 1906 he was dean of the faculty of applied science. In 1892 he became associate editor of the *Engineering Magazine*, in 1893 an editor of *Johnson's Cyclopædia*, and in 1913 a contributor to the NEW INTERNATIONAL ENCYCLOPEDIA. From 1883 to 1906 he was secretary, and in 1907 president, of the American Society of Mechanical Engineers. Columbia University gave him the honorary degree of Sc D in 1904, and Rutgers College similarly honored him in 1913. In 1911 he was consulting engineer for the department of water, gas, and electricity of New York City, and has been chairman of the technical committee of the Automobile Club of America for many terms. He wrote reports on machine tools for the census of 1880, *Mechanical Engineering of Power Plants* (1897, 3d ed, 1909), *Heat and Heat Engines* (1899), *The Gas-Engine* (1903, 3d ed, 1908).

HUTTON, JAMES (1726-97). An eminent British geologist. He was born in Edinburgh and educated at the university in that city. After serving a year's apprenticeship in a law office he relinquished his plan of joining the legal profession and entered upon the study of medicine, taking courses at Edinburgh, Paris, and Leyden. In 1750 he returned to Scotland and for several years was engaged in agricultural pursuits. Upon removing to Edinburgh in 1768 he came in contact with Ferguson, Black, and other savants, who encouraged and directed his scientific investigations. The results of a long and careful research into geological processes were formulated in a paper entitled "Theory of the Earth," which he read before the Royal Society in 1785 and afterward amplified and pub-

lished as *The Theory of the Earth, with Proofs and Illustrations* (1795). This work, although attracting little notice at the time, established a place for its author among the foremost thinkers in the realm of geological science. One of the fundamental principles of Hutton's theory was based on the internal heat of the earth, which has shown itself in past ages by the intrusion of molten rocks into the crust and by upheaval of the superficial strata. This view was combated by the followers of Werner, but it is now generally accepted as correct. He further developed the principle that the study of geological phenomena should be based upon observation of changes going on at the present time and thus in a way originated the doctrine of uniformitarianism (q.v.), afterward elaborated and expounded by Lyell. He also realized very fully the enormous lapse of time which the changes involve in his view nature affords "no vestige of a beginning, no prospect of an end." Such doctrine was out of harmony with the scientific teachings of his age, but finds general acceptance with the leading geologists of the present day. The great value of Hutton's work was not fully appreciated until several years after his death, when Playfair brought out the "Illustrations of the Huttonian Theory." Hutton contributed frequently to the "Transactions of the Royal Society of Edinburgh" and also published several extended works, among the most important of which are *Dissertations on Different Subjects in Natural Philosophy* (1792), *Investigation of the Principles of Knowledge* (1794); *A Dissertation upon the Philosophy of Heat, Light, and Fire* (1794).

HUTTON, LAURENCE (1843-1904). An American essayist and critic, born in New York City and educated privately there. He was an inveterate traveler and for 20 years spent his summers abroad. From about 1870 he contributed continually, as dramatic critic and miscellanist, to periodicals, from 1872 to 1874 he was dramatic editor of the New York *Evening Mail*, and from 1886 to 1898 he was the literary editor of *Harper's Magazine*. He was one of the organizers of the Authors Club and of the International Copyright League. An ardent collector of literary curiosities, his collections were of remarkable interest. In 1892 he received the degree of A.M. from Yale and in 1897 from Princeton. His writings on dramatic subjects include *Plays and Players* (1875); *Curiosities of the American Stage* (1887), *Memoir of Edwin Booth* (1893), and, with Brander Matthews, *Actors and Actresses of Great Britain and of the United States* (1886-87). He edited the *American Actor Series* (1881-82) and published a group of delightful literary guidebooks, including *Literary Landmarks of London* (1887), *Edinburgh* (1892), *Jerusalem* (1895), *Venice* (1896), *Florence* (1897), *Rome* (1897), and *Literary Landmarks of the Scottish Universities* (1904). Consult M. E. Wood (comp.), *Laurence and Eleanor Hutton Their Books of Association* (New York, 1905), and J. Moore, *Talks in a Library with Laurence Hutton* (ib., 1905).

HUTTON, MAURICE (1856-). A Canadian educator. He was born in Manchester, England, and was educated at Magdalen and Worcester colleges, Oxford, graduating with high honors in classics. In 1880 he was appointed lecturer on classics and ancient history at Firth College, Sheffield. He went to Ontario

in the same year and was appointed professor of classics in University College, Toronto. In 1887 he became professor of Greek in, and in 1901 principal of, University College. In 1906-07 he was acting president of Toronto University. He was made a member of the Ontario Educational Advisory Council in 1906 and in 1913 was elected a fellow of the Royal Society of Canada, to whose *Transactions* he contributed.

HUTTON, RICHARD HOLT (1826-97). An English journalist and critic. He was the son of a Unitarian minister and was born June 22, 1826, in Leeds, Yorkshire. The family removed to London in 1835. Hutton was educated at University College School and subsequently at the college itself, with a view to the Unitarian ministry. After two semesters in Germany he returned to London and, finding no adequate sphere in the ministry, he became principal of University Hall. Resigning on account of ill health, which necessitated a trip to the West Indies, he studied law. Under the influence of F. D. Maurice he entered the Church of England. In 1861 Meredith Townsend bought the *Spectator* and called in Hutton to aid him in conducting it. As editor of this paper for 25 years, Hutton exerted great influence. Liberal but not radical in tone, it became in his hands the organ of the very best contemporary thought. As a critic, Hutton came to speak with much authority. His best work is represented by *Essays, Theological and Literary* (1871), containing under the second division essays on Goethe, Wordsworth, Shelley, Byron, Browning, George Eliot, and Clough, and *Essays on Some Modern Guides of English Thought* (1887), treating of Carlyle, Newman, Matthew Arnold, George Eliot, and F. D. Maurice. Two posthumously published volumes of Hutton's are *Aspects of Religious and Scientific Thought* (selections from the *Spectator*, ed. by E. M. Roscoe, 1899) and *Brief Literary Criticisms* (ed. by E. M. Roscoe, 1906). He also wrote a life of Scott (1878) and edited the *Biographical Studies of W. Bagehot* (1881). Hutton died Sept. 9, 1897, at Crossdepe. Consult J. Hogben, *R. H. Hutton of the Spectator: A Monograph* (2d ed., Edinburgh, 1900).

HUXLEY, THOMAS HENRY (1825-95). An English naturalist and comparative anatomist. He was born at Ealing, now a suburb of London, May 4, 1825. He studied in the Medical School of Charing Cross Hospital, and in 1845 was graduated as M.B. and medalist at the University of London. In 1846 he was appointed assistant surgeon on the *Rattlesnake* of the royal navy, commanded by Capt. Owen Stanley, which was to survey the region of the Great Barrier Reef, east and north of Australia. Imbued with a passion for natural history, Huxley devoted himself to the study of the marine animals seen and collected during the four years of this survey service. His most important research, "On the Anatomy and the Affinity of the Medusa," was published during his absence and placed its author in the front rank of biologists. He demonstrated that the body of the medusa is essentially built up of an inner and an outer membrane, which he asserted were the homologues of the two primary germinal layers in the vertebrate embryo. (See EMBRYOLOGY.) This discovery stands at the basis of modern philosophical zoology and of a true conception of the affinity of animals.

In 1850, on his return to England, Huxley

THOMAS HENRY HUXLEY
FROM THE PORTRAIT BY A. LEGROS

began a hard struggle against adversity and discouragement. Disappointed in the hope that the Admiralty would provide for the publication of his notes and drawings, he published the more important in the *Philosophical Transactions* (1851) and in the same year was elected a fellow of the Royal Society, which in 1852 gave him its medal. In 1854 he succeeded Edward Forbes as professor of natural history and paleontology at the Royal School of Mines. This was in the line of direct advancement, for his great ability as an educator and administrator as well as in original research brought him to many posts of honor, such as, in 1855, the Fullerian professorship of comparative anatomy at the Royal Institution, in 1863, the Hunterian professorship at the Royal College of Surgeons, in 1868, the presidency of the Ethnological Society, in 1869, the presidency of the Geological Society, in 1870, the presidency of the British Association for the Advancement of Science and a seat on the first school board of London, in 1871, the secretaryship of the Royal Society, of which he became president in 1883, in 1872, the lord rectorship of Aberdeen University, in 1881, the professorship of biology in the Royal College of Science (an expansion of the earlier chair in the Royal School of Mines), in 1892, Privy Councillor. He served on no fewer than 10 royal commissions, of which the most important were that of Inquiry into the Sea Fisheries (1864-65) and that on Scientific Instruction and the Advancement of Science (1870-75).

Huxley's gifts of exposition were as remarkable as his powers of research. His scientific lectures, like his papers, were models of clearness as well as accuracy, and he was both cogent and eager in debate, and fascinating in popular address. In 1858 he delivered the Croonian lecture on the "Origin of the Vertebrate Skull," in which he disposed forever of the hypothesis that the skull is, homologically, an expanded section of the vertebral column. The very next year *The Origin of Species* was published. Convinced by its arguments, Huxley threw himself heart and soul into their support, adducing much telling corroboration from his own investigations. His series of lectures to London workmen in 1860 had this for their theme and did much to further the acceptance of the new doctrines. They were the basis of the powerful book *Man's Place in Nature* and were succeeded by many addresses, essays, and debates, influential in informing the public and overcoming both scientific objections and religious alarm. It may fairly be said that science as contained in the doctrines of organic evolution, and especially in the views of Darwin, is almost as much indebted to the lucid exposition and bold championship by Huxley as to the originators of the theories. Nevertheless Huxley accepted Darwin's hypothesis of natural selection with a qualification. He pointed out the lack of evidence that any group of animals has, by variation and selective breeding, given rise to another group in the least degree infertile with the first, but he believed this objection might disappear under prolonged observation and experiment. As to Lamarck's theory of use inheritance (qv), he declared, in 1890, his absolute disbelief, as the evidence then stood.

Huxley came to America in 1876 and delivered in New York three lectures on Evolution, taking as his texts the series of fossil horses

During that visit he delivered the opening address at Johns Hopkins University. Huxley's contributions to science were of the widest range and embraced every department of biology. His exposition of the relations of protoplasm as the physical basis of life is particularly masterful. He was not only a man of science, but a publicist. His services were always at command for the promotion of political, social, and moral reform—first and chiefly for the cause of national education. His devotion to labors thus entailed, added to professional toil, did much to undermine his health, which for some years towards the end of his life was very poor. He died at Eastbourne, June 29, 1895.

Professor Huxley bore an honorable part in creating the knowledge which will make the nineteenth century memorable and a great part of it was made permanent in a series of books, of which the following is a complete list: *Oceanic Hydrozoa* (1859), *Evidence as to Man's Place in Nature* (1863), *Elementary Physiology* (1866, 4th ed, 1885), *Lay Sermons, Addresses, and Reviews* (1870, 3d ed, 1887), *Anatomy of Vertebrated Animals* (1871), *Critiques and Addresses* (1873), *Elementary Biology*, with Dr H N Martin (1875, 2d ed, 1876, 3d ed, ed by G B Howes and D H Scott, 1877), *American Addresses* (1877), *Physiography* (1877), *Hume* (1878), *The Crayfish: An Introduction to the Study of Zoology* (1880), *Collected Essays* (9 vols, 1893-94). These contained some reprinted material as follows: *Method and Results, Darwiniana, Science and Education, Science and Hebrew Tradition; Science and Christian Tradition, Hume, Man's place in Nature, Discourses, Biological and Geological, Evolution and Ethics*, and other essays. Four volumes of Huxley's *Scientific Memoirs*, edited by Sir Michael Foster and Prof E Ray Lankester, were published between 1898 and 1902. An authorized collection of his minor writings appeared in eight duodecimo volumes (New York, 1897-1900).

His *Elements of Biology* became the model for a large number of laboratory manuals, and his *Crayfish* is a classic of the methods of the investigator and the instructor combined. Whatever his theme, the weight and honesty of his thought and the distinction of his style make his works part and parcel of the best books of his time.

Consult Leonard Huxley, *Life and Letters of Thomas Henry Huxley* (2 vols, London, 1900), which contains a complete list of his writings and of the honors awarded him, P C Mitchell, *Thomas Henry Huxley: A Sketch of His Life and Work* (ib, 1900), Edward Clodd, *Thomas Henry Huxley* (New York, 1902), J R A Davis, *Thomas H Huxley* (ib, 1907), John Fiske, "Reminiscences of Huxley," in *Essays, Historical and Literary*, vol 11 (ib, 1907), H F Osborn, *Huxley and Education* (ib, 1910), S P Cadman, "Huxley," in *Charles Darwin and Other English Thinkers* (Boston, 1911).

HUY, u'ê' A strongly fortified town of Belgium, in the Province of Liège, situated amid lofty rocks on both banks of the Meuse, 18 miles from Liège (Map: Belgium, D 4). Its summit-crowning citadel, dating from 1322, is partly excavated in the solid rock and commands the passage of the river. The church of Notre Dame, a graceful Gothic edifice, was

begun in 1311 and restored after having been partially destroyed by fire in the sixteenth century. Its many institutions include an atheneum, boys' and girls' school, an industrial school, a theological seminary, and a teachers' institute. The town, in a rich vine-growing district, contains distilleries and paper and cloth mills, and in the vicinity are nonworks, coal, zinc, and tin mines. Pop., 1900, 15,061, 1910, 14,545. In one of the suburbs of Huy was formerly situated the abbey of Neufmoustier, founded by Peter the Hermit, who was interred within it. Huy was taken repeatedly by the Dutch and French in the many wars which swept over this region, and was last captured by Marlborough and Coehoorn in 1703. It was occupied by the Germans during the European War of 1914. For further details, see WAR IN EUROPE.

HUYDECOPER, hor'de-kō'pā, BALTHASAR (1695-1778). A Dutch poet and critic, born at Amsterdam. One of his first books, *Proeve van taal- en dichtkunde op Vondel's Heerschepingen van Ovidius* (1730), or annotations to Vondel's translation of Ovid's *Metamorphoses*, is an important contribution to classical study. So is his edition of the chronicle of *Melis Stoke* (1772). He was the most notable of those who attempted to purify the Dutch language and to render it more flexible. His collected poems were published in 1788. As a dramatist, he was not so successful. Among his plays are a translation of Corneille's *Œdipe* (1720) and *Achilles* (1719), an original drama, for some time very popular. He also made a verse translation of the *Satires and Epistles* of Horace (1737).

HUYGENS, hū'gēnz, Dutch pron hor'gēns, CHRISTIAN (1629-95). A Dutch mathematician, physicist, and astronomer. He was born at The Hague, a son of Constantijn Huygens. He studied at Leyden and Breda, devoting himself at first to law and then pursuing the study of mathematics. At the invitation of Minister Solbert of France, he settled in Paris, being given rooms in the Royal Library and made a member of the Academy. After the revocation of the Edict of Nantes he returned to Holland, where he lived the rest of his life. His early work, *Theorematum de Quadratura Hyperbolis, Ellipsis, et Circuli, ex Dato Portionum Gravitatis Centro* (1651), is an example of the talent which lay at the foundation of all his scientific achievements. This was followed by his *De Circuli Magnitudinis Inventa* (Leyden, 1654), reprinted in Rudol. *Archimedes, Huygens, Lambert, Legendre* (Leipzig, 1892), the object of each work being to expose the fallacies of Gregoire de Saint-Vincent. He also worked on the doctrine of probabilities already founded by Pascal and Fermat and published *De Ratiocinatione in Ludo Aleæ* (1656). Huygens was the first to apply the pendulum to clocks and to use the device to determine the acceleration of gravity. A complete description of Huygens's apparatus is contained in his great work, *Horologium Oscillatorium, sive de Motu Pendulorum* (1673). He also developed and gave precision to the investigations of Galileo upon accelerated motion under the action of gravity, and there is no doubt that to his studies and discoveries his great successor, Newton, in preparing his magnificent development of the principle of accelerating force, was largely indebted. Newton was a student and admirer

of his works and assigns to him, along with Sir Christopher Wren and Wallis, the distinguished epithet of *hujus ætatis geometrarum facile principes*.

Huygens was the first to construct powerful telescopes and in 1655 discovered the ring of Saturn and the fourth satellite of that planet. In 1659 he published an account of these discoveries in a work entitled *Systema Saturnium*. In the end of this work is described an invention of great importance in astronomy, viz., the micrometer (qv), by which small angles between objects viewed by a telescope are accurately measured.

In 1660 Huygens visited England, where he was admitted a member of the Royal Society. Huygens was the originator of the wave theory of light, and his theory, now accepted, was first stated by him in 1678, in his *Traité de la lumiere* (first printed in 1690, modern German translation in *Ostwald's Klassiker No 20*, Leipzig). In this theory light is conceived to be a form of motion in the medium through which it passes. (See LIGHT.) Later (1690) he was able to explain both reflection and refraction by wave motion in the ether and was also able to account for double refraction. To Huygens is due the discovery of polarization—a phenomenon which could not then be explained by the undulatory theory and led Newton to adopt the emission theory. Huygens was in error, however, in believing that the vibrations were longitudinal rather than transverse. The undulatory theory, however, did not gain general acceptance until the nineteenth century, when the experiments of Young and Fresnel placed it on a firm basis.

A new edition of Huygens's collected works has been published by the Holland Academy of Sciences in 10 volumes (The Hague, 1888-1905). For his biography, consult P. Harting, *Christian Huygens in zijn Leven en Werken geschilderd* (Groningen, 1868), and Bosscha, *Christian Huygens*, German translation by Engelmann (Leipzig, 1895).

HUYGENS, CONSTANTIJN (1596-1687). One of the greatest writers in Dutch literary history. He was born at The Hague. His father was secretary to the State Council, and from childhood he was trained to diplomacy, and in every polite art. Intellect in him was joined to beauty and strength. He studied at Leyden, London, and Oxford, and became a warm friend of Dr. Donne. Returning to Holland in 1620, he was sent on a diplomatic mission to Venice and twice to London (1621-23), where he was knighted by James I (1622). Meantime he had published *Batava Tempe*, a versified series of local legends and scenes, and a volume of satires, *Costelick Mal*. Then followed (1625) a large volume of miscellaneous poems, *Ota, Ledige uren*. That year he was made private secretary to the stadholder and in 1630 member of the Privy Council, wherein he long used political power with vigor and wisdom. In 1634 he translated Donne's poems and on the death of his wife (1637) composed *Daghwerck*, a sort of didactic elegy suggesting the manner of Tennyson's *In Memoriam*. *Hofswijck*, a poem on moral life, appeared in 1654. A collected edition of his poems appeared as *Korenbloemen* in 1658, his solitary drama, *Tryntje Cornelis*, in 1659. Although Huygens was not the greatest of Dutch poets or of Dutch statesmen, he was, in the combination of his qualities, one of the

most dignified and brilliant figures of the days of Holland's greatness. As a poet, he had more feeling for form and mastery of language, more ease and facility, than any other in his language. His complete works appeared in three parts in Groningen (1802-93). Consult his two practical autobiographies *De Vita Propria* (Amsterdam, 1817) and *Cluysweck* (ib, 1841). A D Schinkel, *Bejdrage tot de kennis van het Karakter van Constantijn Huygens* ('s-Gravenhage, 1842), A J Dumesnil, *Histoire des plus célèbres amateurs étrangers* (Paris, 1860), Jorissen, *Constantijn Huygens* (Amsterdam, 1871).

HUYGENS'S PRINCIPLE See LIGHT

HUYSMANS, his'mans, CORNELIS (1648-1727) A Flemish landscape painter, born at Antwerp. He was a pupil of Gaspar de Wit in Antwerp and of Jacob van Artois in Brussels, and because he lived a large part of his life in Malines (Mechlin) old catalogues sometimes mistakenly call him Michiel. There are pictures by him in the Louvre, the Hermitage, Hampton Court, the London National Gallery. Van der Meulen, for whom he painted some backgrounds, among them that of "The Investment of Luxembourg" (Nantes), tried to persuade him to come to Paris, but Huysmans refused, because he did not know French. His coloration is even stronger than Poussin's, whom he most resembles, but whose tediousness he does not share. He composed several large sacred pieces, among them the "Christ on the Road to Emmaus," which for many years adorned the choir of Notre Dame of Malines.

HUYSMANS, u's'man', JORIS-KARL (1848-1907) A French novelist, born in Paris, of a Flemish family, some members of which had achieved distinction as painters at Antwerp in the seventeenth century. He began literary life as a disciple of the crassest realism, as one may see by the fact of his contribution to *Les Soirées de Médan*. His novels present every stage of an evolution from sensual materialism, through spiritualism and Satanism, to Christian mysticism, in which there is indeed a curious strain of the sensual and material still. *Marihe* (1876) is a study of sordid prostitution, coinciding significantly in date with Goncourt's *Fille Elisa* and Zola's *L'Assommoir*. In *Les sœurs Vataré* (1879) Huysmans shows himself still a dilettante of moral anguish, sordid wretchedness, and contemptible vice. *En ménage* (1881) is a cynical commendation of marriage, and *A vou-leau* (1882) is a tour de force in nauseating description. Then in *A rebours* (1884) Huysmans turns as it were in a fierce desperation from materialism to a frenzied spiritualism. "All that transfigures or transforms reality enchants him," he makes his hero say. After this there are some barren years save for the insignificant *En rade* (1887) and *Un dilemme* (1887). Then *Lébas* (1891) carries the psychic evolution a step further in the morbid treatment of astrology and Satanism. This recrudescence of the occult and reassertion of the extranatural suggests a fascinated contemplation of religious mysticism, and in *En route* (1895) we find Huysmans indeed "on the road" towards such Christianity as may be consistent with pessimism. From this point the progress is steady and the course plain. *La cathédrale* (1898) carries the reader to the door of a Benedictine retreat, and *L'Oblat* (1902) ushers him within. All this latter work is full

of "fingering spiritual muscles to see if they are growing", it is thoroughly morbid, but thoroughly characteristic, too, of a French generation weary of material progress and of all problems save those that defy solution. Yet, in spite of glaring errors of taste, in spite of a recondite vocabulary and of a studied absence of structural unity, these novels are perhaps the frankest and subtlest analyses of the progress of a pilgrim soul since Bunyan's Christian allegory. And they are essentially autobiographic, for Huysmans, like his hero, retreated for some time to a Trappist monastery and became an unprofessed member of the Benedictine community at Ligugé, 'too much a man of letters to be a monk, too much a monk to stay among men of letters,' as is said of Durtal in the conclusion of *En route*, which is to English readers the most attractive of all his works and 'one of the most characteristic novels of our quarter century.' He wrote *Les foules de Lourdes* (1906). Consult G Coquiot, *Le vrai J. K. Huysmans* (Paris, 1912).

HUYSUM, ho'sum, JAN VAN (1682-1749) A celebrated Dutch painter of flowers and fruits. He was born at Amsterdam, April 15, 1682, and acquired the rudiments of his art from his father, JUSTUS (1659-1716), a landscape painter of considerable talent. Jan at first devoted himself to landscapes, in the classic style, smooth and lifeless, and only later in life began to paint fruits and flowers, studying especially the works of De Heem and Abraham Mignon (qv). His work differed from that of his predecessors in that he preferred to paint upon a light background. He surpassed in mellowness, purity, and delicacy of coloring, and in the exquisite disposition of his lights and shadows. He was fond of introducing birds' nests with eggs, dewdrops, insects, butterflies, and like motifs, rendered with such realism as almost to produce an illusion. The tissue of his flowers and the soft down of his fruit are incomparable in delicacy. His works were very popular and commanded the highest prices. He died at Amsterdam, Feb 7, 1749. Huysum's masterpieces are in the chief German and Dutch galleries, especially those of Berlin and Amsterdam, also at St Petersburg and Vienna, the Louvre is the richest of all, having 10 pieces, and there are excellent examples in the English private collections.

HUZVARESH, hūsh-va'rēsh. See PAHLAVI LANGUAGE AND LITERATURE

HWANG-HAI, hwang'hi' See YELLOW SEA

HWANG-HO, hwang'ho' See HOANG-HO.

HWANG-HSING See HUANG-HSING.

HWANG-TI, hwang'tē' (Chin, Yellow Emperor, or Ruler). The third of the *Wu Ti* (or Five Sovereigns), who are reputed to have governed China in its legendary period, prior to 2356 B.C. Like Fu-hi (qv) and many more of the great leaders of Chinese primitive times, his birth was miraculous, and many wonderful things are attributed to him. As an infant, he was said to have had a full command of language. The year 2697 B.C. is given as the first of his reign, and as he ruled under the influence of the element earth, he became known as the Yellow Emperor—a circumstance which, if he ever lived, might point to the region now known as Shensi (qv) as the location of his realm. There the earth is yellow, the atmosphere is tinted with yellow, and trees, houses,

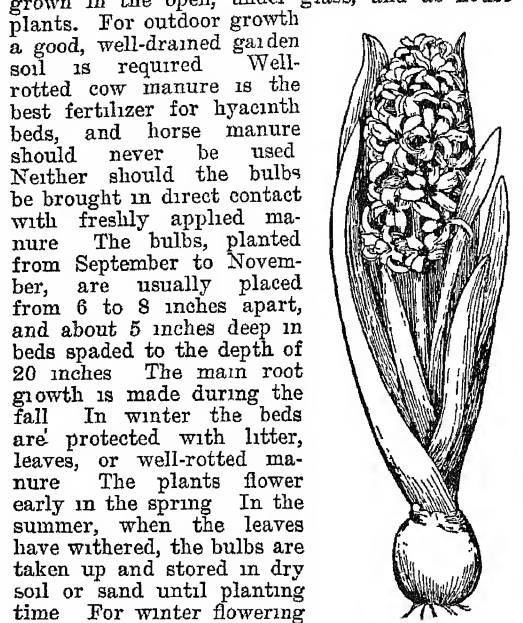

etc., are covered with the yellow dust from the mantle of loess (qv) which covers half the province. Yellow is still the favorite Chinese color. He extended his Empire east to the Sea of Shantung, west beyond the modern Province of Kansu, south to the Yang-tse-kiang. In the north he drove back the Hun-yu, the traditional foes of the Chinese. He is said by the Chinese to have regulated the calendar and to have introduced in the sixty-first year of his reign the sexagenary cycle by which successive days have ever since been designated, the application of the cycle of years dating only from the Han dynasty (which began in 206 B.C.). He is also credited with having introduced a decimal system, the arts of wood, pottery, and metals, boats and wheeled vehicles, and many other beneficent things. To Hwang-ti's wife is due the credit of having been the first to instruct the people in the rearing of silkworms. Hwang-ti was a virtuous ruler, and his reign was prosperous, though he ruled with an iron hand. He was merciless to rebels, but kind to his loyal subjects. He died at the age of 111 and was succeeded by his eldest son, Shau-hau (2597 B.C.). Consult the *Chinese Repository*, vol. xi (Canton, 1843), W. F. Meyers, *Chinese Reader's Manual* (Shanghai, 1874), De la Couperie, *The Western Origin of Chinese Civilization* (London, 1884); Dyer Ball, *Things Chinese* (New York, 1893), Friedrich Hirth, *The Ancient History of China* (ib., 1911).

HWEI-SANG, hwā'sang' (c. 420-c. 505). A Buddhist monk, who traveled to the land Fusang, which has been identified by some with Mexico. In 499 Hwei-sang came to King Chow, the Imperial city of the dynasty of Tsi, and in 502 told the Emperor the story of his travels in Fusang, a country to the east, so called from a plant, the *fusang*. His story was taken down in writing, its principal point was that Fusang had been converted to Buddhism by monks from Cabul in 458. The identification of Fusang with Mexico was first made by De Guignes in 1761, in the *Mémoires de l'Académie des Inscriptions et Belles-Lettres*, vol. xxviii, and was laughed at. In later times (1862-63) Gustav d'Eichthal upheld the theory, and (1875) so did Charles G. Leland. (Consult his *Fusang, or the Discovery of America*.) But the strongest impetus given to this belief was by Vining, *An Inglorious Columbus* (1885), and by John Fryer (1901), in *Harper's Magazine* (vol. ciii, pp. 251 et seq.), and in *Harper's Encyclopædia of United States History*, "Hui Shen," which should be consulted. He finds traces of Buddhist art in the idols of the Aztecs; of lama in the Aztec *tlanas*, of Gautama, in Guatemala, Huatomo, Guatemala, of Sakhya in Oaxaca, Zacatecas, Sacalepec, Zacatlan, Sacapulas, and Taysacca; of a correspondence between Fusang from fusang, and Mexico from maguey (or agave), while he explains away all difficulties by mistakes in the report of Hwei-sang's story due to his imperfect knowledge of Chinese and by the changes wrought in Mexico by the invasions of the Spanish.

HWLFFORDD, hul'fôrth. See HAVERFORD-WEST.

HYACINTH, hi'a-sinth (from OF *hyacinthe*, from Lat *hyacinthus*, from Gk. *ῥάκινθος*, *hyakynthos*, hyacinth, of doubtful etymology, hardly connected with Lat. *juvenis*, Skt *yuvan*, Eng *young*), *Hyacinthus*. A genus of bulbous plants of the family Liliaceæ, with linear radical leaves

and many flowers on leafless scapes. The blossoms are either erect, spreading, or drooping, and arranged in loose or dense racemes. The genus comprises about 30 species, of which three are natives of southern and tropical Africa and the rest of Asia Minor, Syria, and Persia. The few cultivated species are native to the region east of the Mediterranean Sea, and among them *Hyacinthus orientalis*, which has become naturalized in southern Europe, is by far the most important. The numerous varieties have single and double flowers of many different colors. The hyacinth has long been in cultivation, and about the beginning of the eighteenth century it stood almost first in popularity among florists' flowers, and many new varieties were produced. Then, as now, Holland, owing to its favorable climatic and soil conditions, was the principal hyacinth-growing country. Hyacinths are grown in the open, under glass, and as house plants. For outdoor growth a good, well-drained garden soil is required. Well-rotted cow manure is the best fertilizer for hyacinth beds, and horse manure should never be used. Neither should the bulbs be brought in direct contact with freshly applied manure. The bulbs, planted from September to November, are usually placed from 6 to 8 inches apart, and about 5 inches deep in beds spaded to the depth of 20 inches. The main root growth is made during the fall. In winter the beds are protected with litter, leaves, or well-rotted manure. The plants flower early in the spring. In the summer, when the leaves have withered, the bulbs are taken up and stored in dry soil or sand until planting time. For winter flowering the bulbs are started in the dark, and later on the plants are brought to bloom in the forcing house. As house plants, they are grown in hyacinth glasses with water only. Roman hyacinths are a form of *Hyacinthus orientalis* which produce three or four small flower spikes instead of a single large one. Two other species, *Hyacinthus amethystinus*, or Spanish hyacinth, and *Hyacinthus ciliatus*, are also cultivated to a small extent. There are a number of other plants, commonly called hyacinths, which belong to other genera of Liliaceæ. Among these are the grape (or globe) hyacinth and the musk hyacinth of the genus *Muscari*, the *Hyacinthus candicans* of gardeners, which is *Galtonia candicans*, the wild (or wood) hyacinth of Great Britain (also called bluebell) is *Scilla festalis*. The water hyacinth (*Eichhornia speciosa*), which occurs in American tropical and sub-tropical streams, often constitutes a hindrance to navigation. It belongs to the family Pontederiaceæ. See Colored Plate of AQUATIC PLANTS.

DUTCH HYACINTH

The brownish or reddish transparent variety of zircon, especially that found in Ceylon, frequently used as a gem. The name is also applied to similarly colored transparent

minerals, chiefly to the hessonite variety of garnet. See GEMS, GARNET

HYACINTHE, *h'a'sint'*, PÈRE See LOYSON, CHARLES JEAN MARIE

HYACINTHEUS (Lat., from Gk *ῥάκυνθος*). In Greek mythology, according to the usual story, the son of the Spartan King Amyclas, who reigned at Amyclæ. He was beloved by Apollo, who, while teaching the boy to throw the discus, accidentally struck and killed him. Later writers said that Zephyrus, also a lover of Hyacinthus, in jealousy by his blast turned the discus from its course against Hyacinthus. His grave was shown at Amyclæ, and on the throne of the image of Apollo, which stood over the grave, was represented the reception of Hyacinthus and his sister Polybœa into Olympus. The Hyacinthia, celebrated in his honor for three days each spring, were among the greatest Laconian solemnities, and Amyclæ the most sacred place in Laconia. (See GREEK FESTIVALS, in the paragraph devoted to the festivals at Sparta.) From the blood of Hyacinthus sprang the hyacinth, with the lament *AI* (*Ai*, *Alas*) on each petal. This flower is almost certainly not our hyacinth, but a species of iris. Consult L. R. Farnell, *Cults of the Greek States*, vol. iv (Oxford, 1907), and J. G. Frazer, "Adonis, Attis, and Osiris," book II, chap. 7, in his *Golden Bough*, part iv (3d ed., London, 1914).

HYADES, *hi'a-dēz* (Lat. nom. pl., from Gk *ῥάδες*, the rainy ones). In Greek mythology, nymphs of Dodona (*qv*), associated with the fructifying effect of moisture. They were the nurses of the newborn Bacchus and were rewarded by Zeus by being placed among the stars near the head of the Bull. According to another account they were daughters of Atlas and *Æthra* or *Pleione*, and sisters of the *Pleiades*, and were changed into stars after their death from grief at the loss of their brother Hyas, who was killed by a snake. The rising of these stars in spring (April) and their setting in the autumn (November) were looked on by the Greeks and the Romans as signs of wet weather. The name was sometimes rendered by the Romans *Suculæ*, 'little pigs,' because they derived *ῥάς* from *ῥσ*, 'sow'—rightly, in the opinion of some modern scholars. Consult Homer, *Iliad*, edited with English notes and introduction by Walter Leaf, book xviii, 486 (2d ed., London, 1902).

HYÆNODON, *hi-ên'o-dôn* (Neo-Lat., from Gk *ῥαῖνα*, *hyaina*, hyena + *ὀδούς*, *odous*, tooth). An extinct doglike creodont mammal. Fossil skeletons have been found in the late Eocene and early Miocene terrestrial deposits of North America and Europe. It was the latest and most specialized member of the *Creodonta*. Its head is very elongate with a strong posterior crest, the lower jaw is long and slender, and the canine teeth of both jaws are prominent. The body was of slender build, the legs rather short, the feet semiplantigrade, each foot with five clawed toes.

HYALITE. A transparent, colorless variety of opal, occurring in rounded masses resembling drops of water.

HY'ATT, ALPHEUS (1838-1902). An American naturalist. He was born at Washington, D. C., and was educated at the Maryland Military Academy, at Yale College, and the Lawrence Scientific School, Cambridge, from which he graduated in 1862. He served as a volunteer

throughout the Civil War, rising to the rank of captain. He afterward renewed his studies, becoming curator of Essex Institute, Salem, Mass., in 1867. He was the principal founder of the American Society of Naturalists and its president in 1883-84, organized a seaside laboratory at Annisquam, Mass., took part in the organization of the Marine Biological Laboratory at Woods Hole, Mass., and assisted in the founding of the Peabody Academy of Sciences, and became its curator in 1869. He was also one of the founders of the *American Naturalist*. In 1870 he became custodian, and in 1881 curator, of the Boston Society of Natural History, and in 1881 was appointed professor of zoology and paleontology at Massachusetts Institute of Technology and at Boston University.

He was elected a member of the National Academy of Sciences in 1875, was a corresponding member of the Geological Society of London, in 1898 received the degree of LL.D. from Brown University, and was a vice president of the American Academy of Arts and Sciences, Boston. His work as a paleontologist was masterly, besides making many innovations in the classification of the nautiloids and ammonites (*qv*), the final results form the most valuable contribution to the philosophy of biology. He was the founder of the new school of invertebrate paleontology. In systematic zoology he will be remembered for being next to the first one to refer the sponges to a distinct phylum. He also proposed many new genera, families, and numerous suborders of fossil cephalopods. He discovered the law of acceleration in the evolution of Cephalopoda and the mechanical causes of their evolution, of his work on the fossil pond snails of Steinheim and the origin of their various forms, Sir R. Owen wrote that it was "a model of the way and aim in and by which such researches should be conducted."

Hyatt wrote, besides many shorter articles *Observations on Freshwater Polyzoa* (1866), *Revision of North American Porifera* (1875-77), "The Genesis of the Tertiary Species of Planorbis at Steinheim," in *Memoirs of the Boston Society of Natural History* (1880), *Genera of Fossil Cephalopods* (1883), *Laical Theory of the Origin of Cellular Tissue* (1884), *The Genesis of the Arctida* (1889). He has edited *Guides to Science Teaching* and revised the part of the *Zittel-Eastman Text-Book of Paleontology* on Nautiloids and Ammonoids. These works make him prominent among the new school of American zoologists, led by Cope and Packard, which called itself Neo-Lamarckian. Professor Hyatt died at Cambridge in 1902. Consult A. S. Packard, "Alpheus Hyatt," in *Proceedings of the American Academy of Arts and Sciences*, vol. xxxviii (Boston, 1903), W. K. Brooks, "Biographical Memoir of Alpheus Hyatt," in *Biographical Memoirs of the National Academy of Sciences*, vol. vi (Washington, 1909).

HYATT, ANNA VAUGHN (1876-). An American sculptor, born at Cambridge, Mass. She studied at the Art Students' League in New York City and was a pupil of H. H. Kitson, H. A. McNeil, and Gutzon Borglum. Her work, shown at the exhibitions of the Society of American Artists and of the Philadelphia Academy and at the Buffalo Exposition (1901) and the St. Louis Exposition (1904), consists largely of small bronzes of animals. Notable examples are in the Metropolitan Museum of Art, New York. Among larger sculptures by

her are a fox, at Lancaster, N. H., and a colossal lion (1908), at Dayton, Ohio. Miss Hyatt's plaster cast of a life-size equestrian statue of Jeanne d'Arc won an honorable mention at the Paris Salon in 1910, and in 1914 the city of New York decided to place in one of its parks a bronze statue resembling the cast.

HYATT, JOHN WESLEY (1837-) An American inventor, born at Starkey, N. Y. His education was very meagre, and while yet in his teens Hyatt started upon his career as an inventor. His first important invention (1865) was that of a composition billiard ball which, by reason of the scarcity of ivory, became very popular. Four years later, by his discovery of a means of dissolving pyroxylin under pressure, he laid the foundations for the present immense celluloid industry. (See CELLULOID.) Undoubtedly Hyatt's greatest contribution to science, however, was the scheme he devised in 1881 for the purifying of large bodies of water. The success of his method has been attested by the general use made of it both in the United States and abroad. In 1900 he invented a lock-stitch sewing machine with 50 needles, for sewing belting, and later he patented a method of solidifying hard woods.

HYBLA (Lat., from Gk. Ὑβλη). The name of two towns in ancient Sicily, of uncertain sites. According to one view, Hybla Maior (or Hybla Megara) was situated on the seacoast, not far from Syracuse, and Hybla Minor (Hybla Geleatis) at the foot of Etna, on the site now occupied by the town of Paterno. Both were originally cities of the native inhabitants and were afterward Hellenized. From Hybla Maior came the Hyblæan honey, rendered so famous by the Roman poets. Consult Karl Baedeker, *Southern Italy and Sicily*, pp. 414, 432 (16th Eng. ed., Leipzig, 1912).

HYBODUS, hib'o-dūs (Neo-Lat., from Gk. ὕβος, *hybos*, hump + ὀδός, *odous*, tooth). An extinct genus of cestracant sharks found fossil in the Triassic and Jurassic rocks. Finely preserved skeletons of this shark have been found in the Liassic deposits of England. These fish had blunt heads, jaws armed with 9 to 10 rows of sharp, conical teeth, fins armed with long, sharp, anterior spines, and the skin was covered with shagreen, consisting of small pointed plates. Two sharp curved spines on each side of the head behind the eyes were present on the males only and perhaps served as offensive organs. The species varied from 3 to 6 feet in length. See SHARK.

HYBRID (from Lat. *hybrida*, *híbrida*, *íbrida*, hybrid), in plants. The progeny of parents which belong to different species or races. See HYBRIDITY.

HYBRIDITY. The phenomenon of the sexual crossing of two individuals belonging to distinct species. A hybrid is the product of this crossing and is contrasted with a mongrel, or the product of individuals belonging to distinct races or subspecies of the same species. The importance of hybridity is threefold.

1. *A Test of Species*.—Hybridity has been used by Cuvier and others as a test of species, as contrasted with varieties. It has been asserted that hybrids are sterile, whereas mongrels are fertile. So long as infertility of descendants is used as a criterion of species, this tenet is unassailable, the difficulty arises from the fact that the strict application of the criterion leads us to deny specific distinctions

to animals that are commonly regarded as such—e.g., the dog and wolf, dog and jackal, the hare and rabbit, various species of Bovidae (or oxen), sheep and goat, and, among plants, various forms of rhododendron, gladiolus, dianthus, meotiana, etc. Focke says concerning plants: "Many hybrids, especially those between unlike lines of descent, are infertile, most show a diminished fertility, some a *nearly normal fertility*." It may be concluded, therefore, that the Cuvierian definition of species will not hold. While fertile hybrids are thus not common, the capacity for hybridization in the first generation is widespread.

The question arises, Why are hybrids so often sterile? Various hypotheses have been proposed, but none can be said to be proved. Darwin's hypothesis is thus summarized: "The sterility of first crosses and of their hybrid progeny has not been acquired through natural selection. In the case of first crosses it seems to depend on several circumstances, in some instances on the early death of the embryo. In the case of hybrids it apparently depends on their whole organization having been disturbed by being compounded from two distinct forms, the sterility being closely allied to that which so frequently affects pure species when exposed to new and unnatural conditions of life. He who will explain these latter cases will be able to explain the sterility of hybrids." Wallace has a somewhat different view. A new species arises in connection with some slightly varying conditions of environment. If these are sufficient to create a change in coloration or form, they will, by virtue of correlation, affect also the germ cells and may give rise to a certain amount of infertility. Now, the infertility will be beneficial whenever new species arise in the same area with the parent form, because it would result in a preservation of both of the adapted forms. Consequently, whenever two species which are at the same time adapted and infertile arise, they will retain their respective adapted conditions and will survive. Finally, Catchpool and Romanes have independently suggested an explanation that is worthy of consideration—it is that the sterility of species is not something acquired, but is primary. Whenever from any cause two lots of individuals of one species become partly infertile inter se, those lots are, as it were, segregated. Each of them can develop its own way and give rise to a distinct species. If the species were not thus sterile at the beginning, differentiation would be difficult.

2. *Relation to Inheritance*.—Hybridity is important for the study of the laws of inheritance. Since the parents are more unlike, the nature of their combinations is still more interesting than in the case of ordinary sexual reproduction. Hybrids are particularly apt to show a reversion to an ancestral condition, especially when opposing characters are intermingled. The following rules concerning hybrids have been formulated by Focke: (a) "All the individuals formed by the crossing of two pure species or races are, if they have been produced and grown under the same conditions, exactly like each other, as a rule, or they differ hardly more than specimens of one and the same species are apt to do." This proposition is subject to many exceptions. In certain crosses the female element is predominant in the progeny, in others the male. Especially in cases of alternative

heritage (see HEREDITY) the hybrids may be of two types—the one resembling more the one parent, the other type the other parent (b) “The characteristics of the two crosses may be different from those of the parent species. They differ most from both parent species in size and luxuriance as well as in fertility.” In the case of alternative heritage an interesting rule was worked out by Mendel. In each pair of opposed characters one is dominant (“d”), one recessive (“r”). The first generation of hybrids show only *d* characters. If these breed together, 25 per cent of the offspring show *r* characters, and these are pure *r*, 75 per cent show *d* characters, but only one-third of these are pure *d*, the others being hybrid. These latter, when inbred, break up in the same proportion as before. The consequence of Mendel’s “law of dichotomy” in hybrids is that the proportion of the pure races is constantly increasing in the successive generations descended from a hybrid. “Malformations and curious forms are much more common, especially in the flower parts of hybrids, than in individuals of a pure descent.” Double flowers appear to be formed especially easily in hybrids. Hybrids are frequently infertile, because the pollen is imperfectly formed.

3 *Utility*—Hybridity has great practical utility in agriculture. Many varieties of our domesticated plants have arisen from artificial hybrids. The first generation of hybrids usually gives few results, but great variations continue to appear in subsequent generations. Thus, when two species of hybrid foliaceous plants are crossed, the leaves of the second or third generation are often highly variable. This great variability, on the other hand, renders any favorable variation liable to be lost unless great pains are taken to fix the desired quality by in-and-in breeding, or unless the quality can be reproduced vegetatively, i.e., by cuttings and grafts. The diminished fertility of some hybrids is agriculturally advantageous in the case of plants that can be reproduced vegetatively. Some of the advantageous results of hybridization are as follows (a) Increased Size and Vigor. The hybrid between the English walnut and the California black walnut is of exceptional value, ‘for it grows twice as fast as the combined growth of both parents. The wood is very compact, with lustrous silky grain,’ etc. Another hybrid of the black walnut and the California black walnut produces fruit of much larger size than that of either parent. These are illustrations of a common result of hybridization—increased size and vigor. (b) Increased Hardiness. The production of hardy races of plants is very important, because it carries farther north the limits of agriculture and increases the area of cultivation. Every few years the orange and lemon trees of the Gulf States and California are greatly damaged by freezing weather. The Japanese trifoliate orange is hardy, but has fruit of small size. It is hoped that a hybrid may be obtained between it and the ordinary orange which shall have increased hardiness without loss of size or flavor in the fruit. (c) Adaptation to Warmer Climate. The Kieffer and LeConte pears, which have revolutionized pear agriculture by extending the range of profitable pear growing hundreds of miles southward, are said to be hybrids between the common pear and the Chinese sand pear. (d) Increased Resistance to Disease. When the vast grape industry of France was

threatened with destruction on account of the ravages of the bug *Phylloxera*, immune American species were crossed with the French species, and immunity was gained by them. Similarly the black-rot disease in grapes has been fought by introducing the blood of immune races. (e) Increased Percentage of Starch, Sugar, etc. By hybridization the production per acre of the potato has been doubled, and the starch percentage increased from 15 to 26. While the percentage of sugar in the sugar beet has been hitherto chiefly increased by selection, there seems to be a chance for improvement by hybridization. A hybrid cinchona produces three to four times the ordinary percentage of quinine. (f) Change of Season and Duration of Life. By hybridization plants have arisen fruiting at unusual times, like Burbank’s blackberry and raspberry hybrids. A fairly successful attempt to make the pansy perennial resulted from crossing the garden pansy with the perennial *Viola cornuta*. (g) Acquisition of Odor. The fragrance of the pansy has been improved by crossing with odoriferous Alpine species. (h) Improvement of Quality and Flavor. This result is illustrated by the case of smoking tobaccos, in which the superior-flavored Havana race has been crossed with other races having larger leaves, so that a greater quality of well-flavored leaf has been produced. Altogether, many breeders conclude that by systematic hybridization most species of plants will be found capable of almost indefinite improvement.

In connection with the artificial production of hybrids the phenomenon of “xenia” has recently attracted much attention. This term is applied to cases in which characters of the pollinating parent appear directly in the fruit or seed. It was once thought that only the embryo could show hybrid characters, which would become evident, therefore, only upon the germination of the seed. In cases of xenia, however, the regions of the seed outside of the embryo show hybrid characters, so that it is evident that they too have been influenced by the pollinating parent. The crossing of the races of maize has proved to be most favorable for studying this phenomenon. If a race of maize normally producing white grains be pollinated by one producing red grains, the resulting grains will show the red coloration in various ways. The same result is also obtained in crossing races of sweet and dent corn. This phenomenon was inexplicable until the recent discovery of “double fertilization” among flowering plants. This phrase means that both of the male cells were brought by the pollen tube to the ovule function—one fertilizing the egg, which then produces the embryo, the other uniting with the “endosperm nucleus,” which then produces the endosperm or food substance of the seed about the embryo. It is evident, therefore, that where double fertilization occurs in connection with hybridizing the endosperm as well as the embryo is a hybrid, and that the resulting seed may show characters of the pollinating parent. See ANGIOSPERMS, FERTILIZATION, PLANT BREEDING.

Methods of Hybridizing. The methods of hybridizing plants are simple. If the flower is hermaphroditic, its stamens must be cut away before they are ripe—usually before the corolla opens—and the flower must be tied up in a paper bag. When the stigma is ripe, the pollen

is placed on it, and the bag tied over the flower again and not removed until the seed begins to form. If the flower bears no stamens, it requires, of course, no operation except the tying up while in the bud to prevent the access of foreign pollen. Among animals much less experimentation in producing hybrids for commercial purposes has been done.

HYBRIDITY IN ANIMALS

The number of animal hybrids known to have been produced or actually to exist is not large. The only special work on hybrids is that of Suchetot, the first volume (1001 pages) being devoted to birds alone.

Of hybrids produced by nature we have on record comparatively few examples, but the number is probably quite considerable. It is known that fish, especially the Salmonidae, readily hybridize. There are on record over 100 cases of hybrids among insects, and the number probably runs into the thousands. Of amphibians, species of diverse frogs have been seen mating, but it is not definitely known that such unions have given rise to hybrids. Natural hybrids among birds have been described, e.g., between the flicker of the eastern United States and the Mexican flicker, between two species of warblers of the genus *Helminthophila*, between species of geese, various European grouse, and certain Asiatic pheasants.

The hybridism which has taken place among the wild pheasants of the genus *Gemnaeus* in Burma is perhaps the most remarkable instance known. Three species—the black-breasted (*horsfieldi*), the lineated (*lineatus*), and the silver (*mythemus*) kallege pheasants—meet in this country, and from along the borders of their haunts a score of forms have been described and named as legitimate species, whereas they are merely hybrids, exceedingly variable even in the same brood and of interest only as examples of hybridism in nature.

Hybrids Produced Artificially. By artificial fertilization of the ova of different species, and even genera and families, of sea urchins, the early larval stages have been reared, but never carried to maturity, the resulting pluteus stages are more or less monstrous. In one case early larval hybrids between species of two different classes of echinoderms, starfish and sea urchins, were produced. The cases of fertile hybrids of birds and mammals mentioned below were produced in captivity, besides these there have been instances of hybrids between the brown and polar bear, the leopard and jaguar, the lion and tiger, the sea lion and fur seal, between the zebra and horse, the horse and ass, and the common ass and varieties of the kiang.

Hybrids are also known to occur between the dog and fox (Darwin), but this case is doubted by Ewart.

Variations of Hybrids. Darwin has shown that hybrids are more variable and have a greater tendency to vary than the products of pure race of both parents. He also has shown that the products of hybrids are much more variable than the hybrids themselves.

Results of Recent Experiments. Experiments by Standfuss on thousands of specimens of the higher Lepidoptera have shown:

1. The intercrossing of two species may result in anything, from complete sterility to the production of the normal number of fertile eggs.

These extremes may even occur as the result of crossing different individuals of the same two species. Hence a cross must not be pronounced infertile on the evidence of a single failure.

2. Individual differences in the structure of the genital apparatus may prevent effective crossing between some members of two given species, though other members of the same two species may pair freely.

3. Some crossings have resulted entirely in male, others entirely in female, offspring. A third class has given both sexes in various proportions.

As regards the fertility of hybrids, in no case observed by Standfuss or known to him has the female of a true hybrid been shown to be fertile. But the occurrence of undoubted cases of fertility in male hybrids has been proved by crossing the male hybrids with the females of both parent species, and in one case with the female of a third species.

The silk-moth hybrids of *Philosamia cynthia* and *Philosamia ricina*, the arrandy moth, two closely allied species, are also said to have been fertile for eight generations.

Fertility of the Hybrids. It is well known that the mule is infertile, and, though there are reported to be three cases where a mule has produced young, they are doubtful. Ewart, in referring to the instance of the Paris Jardin de l'Acclimatation mule, doubts whether these animals are mules, quoting Ayrault's opinion that the Paris mule was an ordinary mare. Darwin states that he knows of no thoroughly well-authenticated cases of perfectly fertile hybrid animals, though he adds "I have reason to believe that the hybrids from *Cervulus vagmalis* and *Reevesii* and from *Phasianus colchicus* with *Phasianus torquatus* are perfectly fertile." The hare and rabbit are supposed to have fertile offspring, the hybrids of the common and Chinese geese (*Cygnopsis cygnoides*) are fertile, as are hybrids between the common duck and the pintail duck. The crossed offspring from the Indian humped and common cattle interbreed. Caton has hybridized the Virginia deer with the Ceylon deer and the Acapulco deer and says that the hybrids seem perfectly healthy and prolific. The Indian dog and coyote are said by Coues to interbreed, and on the upper Missouri dogs have been seen having every appearance of being such hybrids. Hybrids of hares and rabbits have continued fruitful for generations, the same is true, says Hertwig, of hybrids obtained from the wild buck and the domesticated she-goat. The American bison is known to breed with the domestic cattle, and it seems to be a well-established fact that the hybrids are fertile. Ewart states that the Indian buffalo and the American bison produce fertile hybrids with the wild ox of Europe. Among fishes fertile hybrids have been obtained from the carp and goldfish and from the charr and the brook trout.

Relative Strength of Hereditary Influences. The three following conclusions rest on an elaborate series of experiments by Standfuss with three European species of Saturnia moths.

1. The freshly hatched hybrid larva closely resembles that of the female parent, but with the process of growth a resemblance to that of the male parent gradually increases.

2. The extent of approximation towards the male parent depends on the relative phylogenetic age of the two species—the older being able to

transmit its properties, whether of structure or habit, better than the younger

3 In reciprocal pairing the male is able to transmit the characters of the species in a higher degree than the female. This influence, however, is less regular and potent than that spoken of in the preceding paragraph.

The result of crossing a parent species with a local race, or with an aberration of the same species, is as follows

1 When the normal form of a species (*Grundart*) is crossed with a gradually formed local race of the same species, the result is a series of intermediate forms. 2 On the other hand, when the normal form is crossed with a sporadic aberration, the result in many cases is that the issue divides itself sharply between the normal form and the sport, intermediate forms being absent.

In commenting on these results, Dr F. A. Dixey remarks: 1 The experiments afford fresh illustrations of the manner in which the physiological isolation of an incipient species may be brought about. 2 They show that the statement of Focke as to the great variability of the offspring resulting from the crossing of a plant hybrid with one of the parent species holds good in the case of insects. 3 What Standfuss speaks of as the prepotency of the phylogenetically older of the parent species is probably only another expression of the principle established by Darwin that in many cases crossing causes reversion to a remote ancestor. 4. The general conclusion as to the prepotency of the male parent accords so far with one result of Galton's investigation of the late Sir E. Milnes's breed of basset hounds. 5 The result of crossing a parent species with a gradually formed local race, though less in degree, is much the same in kind as that of crossing two distinct species. 6 The result of crossing the normal form of a species with a sporadic aberration of the same species appears to show that the latter stand biologically on an entirely different footing from the regularly developed variety, even though it may indicate (as alleged by Eimer and by Jordan) the direction in which variation for that species is possible. With Standfuss's instances may be compared the well-known case of the otter sheep, which similarly, when crossed with a sheep of ordinary breed, gave no true intermediates. 7 Certain experiments with aberrations of this kind, of which exact numerical records have been kept for several generations, are of special interest in connection with Galton's law of heredity. See Galton, *Natural Inheritance*, p. 134 (London, 1889).

In still later experiments by Standfuss (1898) he shows that the crossing of two distinct species gives rise to a *Zwischenform*, but not to a *Mittelform*. The latter may, however, exist as a temporary stage in larval growth. This depends on the following principles: (1) the freshly hatched larva closely resembles the female parent, (2) with the process of growth a resemblance to the male parent gradually increases, (3) the final extent of approximation towards the male parent depends on the relative phylogenetic age of the two species, the older being able to transmit its properties, whether of structure or habit, better than the younger, (4) in reciprocal pairing the male is able to transmit the characters of the species in a higher degree than the female, (5) when the

normal form of a species (*Grundart*) is crossed with a gradually formed local race of the same species, the result is a series of intermediate forms, (6) when the normal form is crossed with a sporadic aberration, the result in many cases is that the issue divides itself sharply between the normal form and the sport, intermediate forms being absent.

Hence, according to Standfuss, adds Dixey, "the process of species formation must be gradual, for when two distinct species are crossed the issue does not split up into two parental forms, as in the case when one parent is a suddenly formed aberration. On the contrary, the behavior of the issue of two distinct species is very similar in kind to that of a species crossed with a local race or variety which is being gradually established by the accumulation of slight changes. It would seem, therefore, that although an aberration or sport may be perpetuated by inheritance, it can never acquire distinct specific rank. No doubt, however, it may, if selected, eventually replace the original form of the species."

Dixey also makes the interesting suggestion that these sporadic color aberrations "seem to have many points of resemblance with the color varieties in domestic animals, such as the 'lemon and white' and 'tricolor' of the basset hounds, or the well-known tortoise-shell, tabby, and black of cats. The fact that these domestic varieties exist side by side in the same race and even in the same litter, and that true intermediates are rare or absent, seems to suggest that they originally appeared as sports, and that their perpetuation has been insured or favored by artificial selection."

Zebra Hybrids In his *Penycaik Experiments* (1899) Ewart states that he bred nine zebra hybrids by crossing mares of various sizes and breeds with a Burchell zebra stallion, Matopo. The hybrids are interesting because of the curious blending of characters, derived apparently partly from their actual and partly from their remote ancestors, and because they shed new light on many questions of general interest, such as the origin of stripes, reversion, interbreeding, and prepotency.

Reversion. He concludes that "some of the hybrids in make and disposition strongly suggest their zebra sire, others their respective dams, but even the most zebra-like in form are utterly unlike their sire in their markings. It is not a matter of taking after a grandparent, but after an ancestor in all probability thousands of generations removed, an ancestor probably far more like the Somali than any of the Burchell zebras." (This confirms Standfuss's conclusion stated above.) Ewart adds (p. 21) "The reversion may be to recent, remote, or intermediate ancestors, and the tendency will in most cases be to revert to sports that here and there mark the route along which the development has proceeded."

He also, by breeding pigeons, restored the rock pigeon, or primitive form. "In the case of my most typical bird there is, as far as an external examination can show, practically complete reversion." Reversion, he says, "seems to lead to a form of rejuvenescence." He regards polydactylism in the horse as in part due to reversion to the Hipparion, or the three-toed fossil horse. As he well puts it, the cases of reversion that he cites "must be more or less accurate restorations of their comparatively re-

mote ancestors" Reversion also indicates that in some cases "varieties and breeds which have, through interbreeding, undergone senile degeneration, may be regenerated without the loss of their best and most prized characteristics"

Prepotency. It is generally assumed that an old species or variety is prepotent over a more recent species or variety. It is impossible to say whether zebra hybrids in their markings take after a remote zebra ancestor, or after an ancestor common to both zebras and horses, or after a hypothetical midparent combining the characters of the less remote ancestors of both zebras and horses. There is, however, no difficulty in seeing that while some zebra hybrids, apart from their stripes, closely resemble the zebra parent, others take after their horse parent, thus showing that the wild sire is not necessarily the most prepotent. "But even when the hybrids are distinctly horse-like they never repeat recently acquired peculiarities, such as a blaze, or short ears, high withers, or a small head and long neck"

Ewart believes that sports and certain marked variations are often prepotent, and also that inbreeding (see **POLLINATION**) is "common among wild animals, and that by inducing prepotency it plays an important part in the origin of species" It may be here observed that Ewart's experiments lead him to reject telegony (qv) and to explain such occurrences by cases of reversion. The zebra hybrids are also interesting as being "in some respects almost intermediate between their parents" Each parent, he says, hands on its most fixed individual characters. His zebra hybrids are neither new creations nor yet intermediate forms.

Sterility in Hybrids.—Ewart concludes that, as there is no hard and fast line between species and varieties, there can be "no fundamental difference between a hybrid and a cross, nor yet any a priori reason why any given hybrid should be sterile, or any given cross fertile. Sterility has doubtless been acquired in some cases slowly, in others abruptly, but how it has been acquired it is impossible in most cases even to guess"

Mendel's Law. Great interest has been excited among biologists by Mendel's law, and his discovery of certain principles of heredity which will prove of much practical value to breeders of plants and animals and lend a new phase to the theory of heredity and also of evolution, since the results thus far obtained point to discontinuing evolution and the absence of intermediate forms. Mendel's original paper was published at Brunn, Austria, in 1865, but was overlooked until De Vries in 1900 published an exact counterpart of Mendel's theory, while Correns and also Bateson hit upon the same law. As stated briefly by Spillman, it is as follows. In the second and later generations of a hybrid every possible combination of the parent character occurs, and each combination appears in a definite proportion of the individuals. A parent character which is fully developed in the hybrid is said to be "dominant", if it is apparently absent, it is said to be "recessive". A case in illustration is thus stated by Bateson. "In breeding crested canaries the kind of crest desired for exhibition can, according to canary fanciers, be produced most easily by mating crested birds with noncrested, or 'plain heads,' as they are called. If it be supposed that the crested character is usually dominant, we have

a simple explanation. When crested birds are bred together, a number of birds are produced whose crests are coarse and stand up, and others without crests. The latter are the recessives, the former we may suppose to be the pure dominants." The fact that the hornless breeds of goats will give off some horned offspring is probably due to the fact that they are what Bateson terms "heterozygotes," under what is usually called "reversion." From the analogy of cattle, it may be anticipated that the hornless form is dominant. Consult Bateson, *Mendel's Principles of Heredity*, with a translation of Mendel's original papers on hybridization (London, 1902).

Mendel's more important discoveries are also thus stated by Castle: "1 His law of dominance, when, for example, the offspring of two parents differing in respect of one character all resemble one parent and possess therefore the dominant character, that of the other parent being latent or recessive. 2 In place of simple dominance there may be manifest in the immediate hybrid offspring an intensification of character, or a condition intermediate between the two parents, or the offspring may have a peculiar character of their own (heterozygotes). 3 A segregation of characters united in the hybrid takes place in their offspring, so that a certain per cent of these offspring possess the dominant character alone, a certain per cent the recessive character alone, while a certain per cent are again hybrid in nature."

HYBRIDIZING. See **PLANT BREEDING**, **GRAFT HYBRIDS**.

HYDASPES. The ancient name of the river Jhelam in northwest India. See **JHELAM**.

HYDATHODE, hŷdăth-ôd (from Gk *hŷdōp*, *hydōr*, water + *ôdās*, *hodos*, way). In botany, an organ that exudes water. Usually hydathodes occur at the tips of the main veins or branch veins of leaves and commonly appear to the unaided eye as leaf teeth. At the apex

of the organ is a pore which has been variously called water pore and water stoma. These pores differ from ordinary stomata in the absence of turgor movements, often in size and in their function; they are passageways for liquid

1, longitudinal section through leaf tooth of Chinese primrose (*Primula sinensis*), showing the divergent tracheids, terminating the vascular bundle, the loose epithem, and the terminal pore.

2, surface view of a water stoma (terminal pore of a leaf tooth).

water rather than for water vapor. Hydatodes commonly occur in connection with the vascular system and may be regarded as a sort of safety apparatus to prevent injection of the air space with water at times when root pressure is high and transpiration low.

HYDATID (Gk. *hḗdalis*, *hydatís*, water vesicle, hydatid, from *hḗdō*, *hydōr*, water; connected with OChurch Slav. *voda*, Skt. *udān*, water, and ultimately with Goth. *watō*, OHG. *wazzor*, Ger. *Wasser*, AS. *water*, Eng. *water*; AS. *wæt*, Eng. *wet*; OHG. *ottar*, Ger. *Otter*, AS. *otor*, Eng. *otter*). The bladder worm. It is allied to the tapeworm, but is smaller, containing only three or four proglottids, besides the head, and its "cysticercus" stage is large and bladder-like with numerous heads. These develop on secondary "daughter" cysts, attached to the wall of the cysticercus. About 5000 eggs are developed in a single segment (proglottis). The six-hooked embryos develop, are expelled from the dog, the first host, and find their way in drinking water or in food into the human intestines, whence they bore into the liver, their favorite habitat, or are carried along the blood vessels into some other organ, where they develop into bladder-like bodies, or "hydatids" (*Tania echinococcus*). By the fourth week the young is $\frac{1}{16}$ millimeter ($\frac{1}{16}$ inch) in length, and it is probably many months before the echinococcus heads are entirely developed. If transported to a dog, the worms become sexually mature in from seven to nine weeks, when the milk-white worms may usually be found embedded in the mucus of the duodenum and upper part of the small intestines, with their heads attached to the villous surface of the intestine. The parent vesicle may grow as large as a man's head. The cyst in which the bladder worm lies, and which is caused by it, is called a "hydatid cyst."

There are two forms of this hydatid—one

(*Tania hominis*) living in man, and the other (*Tania veterinorum*) in domestic animals. When these echinococcus cysts remain sterile, as they frequently do, they are called "acephalocysts." "Another, and indeed pathological form," says Sedgwick, "is the so-called 'multilocular' echinococcus, which was for a long time taken for a colloid cancer. It is also found in mammalia (in cattle), and here presents a confusing resemblance to a mass of tubercles. The echinococcus disease (*hydatid plague*) was widely spread in Iceland. This disease, likewise, seems endemic in many places in Australia."

HYDATID CYST. See **HYDATID**.

HYDE. A manufacturing town in Cheshire, England, on the river Tame, 7 miles east-southeast of Manchester (Map: England, D 3). Since the extension of the cotton trade it has rapidly increased in size. Besides numerous cotton factories, print and iron works, there are considerable manufactures of machinery, hats, and margarine. Coal abounds in the neighborhood. The district is densely peopled. Hyde has had its entire growth within the last century. It is mentioned as a village in the reign of King John; was incorporated as a municipal borough in 1881, with a mayor, 6 aldermen, and 18 councilors. It owns its water, markets, and cemetery, and maintains free baths, a library, hospital, and fire brigade. Its sewage is chemically treated for fertilizing purposes. Pop., 1901, 32,766; 1911, 33,444.

HYDE, ANNE, DUCHESS OF YORK (1637-71). The first wife of James II of England and the eldest daughter of the Duke of Clarendon. When she was 12 years old, she went to Holland with her mother and sisters and in 1654 was appointed maid of honor to the Princess of Orange at whose court she was a great favorite. It was while accompanying the Princess on a visit to Paris in 1656 that she first met James, then Duke of York. She became engaged to him about a year before his return to England in the spring of 1660 and, in spite of the most vehement opposition from all quarters, was privately married to him in September. Her father disapproved of the affair with great ostentation and afterward, with more sincerity perhaps, attributed his downfall to the match. At first the royal family would not recognize her, and fruitless attempts were made, by attacking her character, to influence the Prince to put her aside. She was an accomplished and attractive woman, though not handsome, and she maintained her position with regal dignity. She joined the Roman Catholic church soon after 1667 and converted her husband to that faith. Her daughters, however, were educated as Protestants. Anne and Mary, who became queens of England, were her only children that survived infancy.

HYDE, DOUGLAS (1860-). An Irish scholar and writer, born at Frenchpark, County Roscommon. He was educated at Trinity College, Dublin. In 1891 he was interim professor of modern languages in the State University of New Brunswick, and he was afterward made examiner in Celtic to the Royal University of Ireland. In 1906 he received the honorary degree of Litt.D. from the Royal University of Ireland, and in 1909 he was elected member of the senate and professor of modern Irish in the National University of Ireland.

Hyde early took up the study of Irish literature, and in particular the collection and publi-

cation of Gaelic songs and folk tales, and his labors in the preservation of native folklore constitute his most valuable services to Celtic scholarship. His *Literary History of Ireland* is the first attempt to write a comprehensive and systematic history of Gaelic literature. His translations of modern Gaelic lyrics are often particularly happy in rendering at once the simple feeling and the complicated metrical structure of the native poetry. He took a prominent part in the organization of the popular movement for the preservation of the Irish language and in 1906 visited the United States in its interests. He was made president of the Gaelic League (qv) at its foundation, in 1893, and also of the Irish Texts Society. In 1894-95 he was president of the Irish National Literary Society. He wrote *Leabhar Sgeulugh-eachta* (1889), *Cois na Teineadh, or, Beside the Fire* (1890-91), *Love Songs of Connaught* (1894), *The Three Sorrows of Story-Telling* (1895); *The Story of the Early Irish Literature* (1897), *An Sgeuluidhe Gaothlach* (3 parts, 1898-1901, Fr trans, 1901), *A Literary History of Ireland* (1899, 4th ed, New York, 1906), *The Lad of the Fenule, etc* (vol 1 of the publications of the Irish Texts Society, Dublin, 1899), *Ubhla de'n Chraoibh* (1900), a volume of poems, and *Sgeuluidhe Fíor na Seachtmháire* (1909). Part of his *Songs of Connaught* were contributed to the *Dublin Nation* (1906). In the same way his edition of the *Poems of Raftery* was published in the *Dublin Weekly Freeman* (1904).

HYDE, EDWARD. See CLARENDON, EDWARD HYDE, EARL OF

HYDE, EDWARD. See CORNBURY, EDWARD HYDE, LORD.

HYDE, EDWARD (c1650-1712). A Colonial Governor of North Carolina. He was appointed by the proprietors to be Governor of the Albemarle District in the Province of North Carolina, but on his arrival in August, 1710, found that the Governor of the province, from whom he was to receive his commission, had died, and that a former Deputy Governor, Thomas Carey, was leading an insurrection, a movement on the part of the dissenters against the establishment of the Church of England. A number of the more respectable residents requested Hyde to assume the office of Governor, which he did, and with the aid of Governor Spotswood of Virginia succeeded in putting down Carey's rebellion. Soon after, however, the North Carolina Indians, led by the Tuscaroras, went on the warpath and massacred many of the settlers. Hyde called on South Carolina and Virginia for aid, and on Jan 28, 1712, a body of South Carolina and North Carolina militia under Colonel Barnwell defeated the Indians on the Neuse River. The greater part of the tribe removed to New York and became the sixth nation of the Iroquois Confederacy.

HYDE, HELEN (?-). An American etcher and engraver. She was born at Lima, N Y, graduated from the Wellesley School, Philadelphia, and studied art at the San Francisco Art Institute under Emil Caislen, in Berlin under Frank Skarbina, in Paris under Raphael Collin, and in Tokyo under Kano Tomonobu. She is noted especially for her etchings in color and her woodcuts of women and children. She first attracted general attention by her etchings of the Chinese children of San Francisco, she then made a series

of woodcuts Mexican in subject, and she spent 14 years in Japan making etchings, water colors, and woodcuts of Japanese children and women. Complete series of her work are to be found in the Congressional Library, Washington, and examples are in the New York Public Library and the San Francisco Art Museum.

HYDE, HENRY BALDWIN (1834-99). An American life-insurance promoter, founder, and president of the Equitable Life Assurance Society. He was born in Catskill, N Y, and before he was 20 years old entered the employ of the Mutual Life Insurance Company of New York as clerk, becoming cashier in 1856. In 1859 he founded the Equitable Life Assurance Society in competition with the Mutual Life Insurance Company, and until his death he was its master spirit and dictator. His aim to make it the largest life insurance company in the world led to a fierce contest for business. He attempted to transmit his control to his son, James Hazen Hyde (qv).

HYDE, JAMES HAZEN (1876-). An American insurance official, son of Henry Baldwin Hyde. He was born in New York City and graduated from Harvard University in 1898. In 1899, upon his father's death, he became vice president of the Equitable Life Assurance Society of the United States. His disagreement with James W Alexander, the president of this company, led in 1905 to an investigation of the company's affairs, with the result that both factions retired. (See LIFE INSURANCE.) Hyde was chosen vice president and trustee of the Equitable Trust Company and a director in a large number of banks, railroads, and other corporations. After his break with the Equitable he removed to Paris, was made Officer of the Legion of Honor, and in 1913 married a daughter of John G A Leishman (qv), the widow of Count Louis de Gontaut-Biron.

HYDE, LAURENCE. See ROCHESTER, EARL OF

HYDE, THOMAS (1636-1703). A famous English Orientalist, born at Billingsley in Shropshire. Educated at Cambridge, he was an assistant to Walton in an edition of his *Polyglot Bible*. Besides correcting the Arabic, Syriac, and Persian texts, he transcribed in Persian characters the Persian translation of the Pentateuch which had been printed in Hebrew letters at Constantinople and appended a Latin version of his own. In 1658 Hyde entered Queen's College, Oxford, to which he was shortly after made Hebrew reader. In the following year, after graduating as M A, he was chosen underkeeper and finally librarian in chief of the Bodleian Library. In 1660 he was made a canon of Salisbury, in 1678, Archdeacon of Gloucester. He succeeded Pococke in 1691 as Laudian professor of Arabic and soon after, on the deprivation of Altham, became regius professor of Hebrew and canon of Christ Church. Hyde's most important work was the *Historia Religions Veterum Persarum eorumque Magorum* (1700, 2d ed, 1760). His other works were collected by G Sharpe, *Syntagma Dissertationum* (1767). They include a history of the game of chess, a translation into Malayan of the Gospel and the Acts, a treatise on the weights and measures of the Chinese, etc.

HYDE, WILLIAM DEWITT (1858-). An American college president, born at Winchendon, Mass. He graduated from Harvard University in 1879 and from Andover Theological Seminary in 1882. Ordained to the Congregational min-

istry in 1883, he was a pastor at Newark, N J, in 1883-85, and thereafter was president of Bowdoin College, also holding the chair of mental and moral philosophy. He is author of *Practical Ethics* (1892), *Social Theology* (1895), *Practical Idealism* (1897), *God's Education of Man* (1899), *The Art of Optimism* (1900), *The Cardinal Virtues* (1901), *Jesus' Way* (1902), *The New Ethics* (1903), *The College Man and the College Woman* (1906), *Abba, Father* (1908), *Self-Measurement* (1908), *Sin and its Forgiveness* (1909), *The Teacher's Philosophy in and out of School* (1910), *The Five Great Philosophies of Life* (1911), *The Quest of the Best* (1913).

HYDE DE NEUVILLE, J G, BARON See NEUVILLE, JEAN GUILLAUME, BARON HYDE DE

HYDE PARK An inclosure of 364 acres in London, England, about $2\frac{1}{4}$ miles west of St Paul's Cathedral (Map London, E 6). It derives its name from Hyde Manor, which belonged to the abbey of Westminster. It became the property of the crown on the dissolution of the monasteries, in the reign of Henry VIII. After this monarch it became famous as the scene of duels, deer hunts, and horse races. Charles II laid out drives and promenades which became fashionable and have ever since continued to be. It also serves as the place of large popular meetings. It has nine carriage entrances, and among its prominent features are the Serpentine (an artificial sheet of water constructed by order of Queen Caroline in 1730), Rotten Row, the Ladies' Mile, the Marble Arch, the Hyde Park Corner gateway, the statue of Lord Byron, and Westmacott's colossal statue of Achilles, erected in honor of the Duke of Wellington and cast from cannon captured at Waterloo.

HYDE PARK Formerly a town in Norfolk Co, Mass, annexed to Boston in 1912 (Map Boston and Vicinity, D 7). It has a public library and extensive manufactures of cotton, woolen, and rubber goods, paper, dyestuffs, looms, morocco, tools and machinery, cars, engines, motors, and curled hair.

HYDERABAD, or HAIDARABAD, hi'dā'-a-bad' A large native state of India, called also the Dominions of his Highness the Nizam. It occupies the central part of the Indian peninsula, being bounded on the north by Berar and northeast by the Central Provinces, on the southeast by Madras, and on the west by Bombay (Map India, C 5). Area, 82,698 square miles. The surface is an extensive plateau, with an average elevation of about 1250 feet, diversified by mountain, valley, and plain, and watered by the Godavari with its affluents the Dudna, the Manjra, and Pranhita, the Kistna with its affluents the Bhima and Tungabhadra, and the Wardha with its affluent the Penganga. The climate is fairly healthful, the annual precipitation registers 28 to 32 inches. The geological formation is a base of granite, gneiss, and talc slate, superimposed by clay, limestone, sandstone, hornblende, feldspar, and in some districts columnar basalt. Iron and coal are mined, and gold, garnet, and diamond beds, which formerly supplied the Golconda treasury, still exist, although modern mining operations for the precious minerals have hitherto been unremunerative. The soil is comparatively fertile, over 35 per cent of the area is under cultivation, and over 45 per cent of the population is supported by agriculture. Millet is the largest

agricultural product, others of importance are cotton, rice, sesamum, wheat, castor seed, grain, and linseed. Fruit culture, market gardening, pasturage of cattle and of sheep, and horse breeding are other agricultural branches. Bad seasons, notably in 1899-1900, have resulted in famine. There are domestic manufactures of silk, woolen, and cotton fabrics, carpets, and leather. Raw silk, cotton, hides, dyestuffs, gums, and resins are exported, and cereals, cloth goods, hardware, salt, and timber are imported. Good military roads traverse the state, and in 1901 there were 858 miles of railroad open. The ruler, the Nizam, is a Mohammedan, as are also the government officials, although the subjects are chiefly Hindus. There is a British Resident and adviser at Hyderabad, the capital. The annual revenue is over 45,000,000 rupees. The population in 1891 was 11,537,040, in 1901, 11,141,142 (the decrease being 3.4 per cent), in 1911, 13,374,676 (increase, 20 per cent), of the latter number, 6,797,118 were males and 6,577,558 were females. According to the 1911 census Hindus numbered 11,626,355, Mohammedans, 1,380,990, Animists, 285,722, Christians, 54,296 (of whom 18,473 Roman Catholics, 13,929 Anglicans, 8998 Baptists, and 8524 Methodists), Jains, 21,026, Sikhs, 4726, Parsis, 1529. Education made considerable progress during the latter part of the nineteenth century, but only a small proportion of the children attend school of the total population of 13,374,676 in 1911, 13,006,510 were illiterate. Literates numbered 368,166 (344,089 males, 24,077 females), literates in English, 26,526 (22,965 males, 3561 females).

Hyderabad, formerly attached to the dominions of the rajahs of Telangana and Vijayanagar, in 1512 became a separate kingdom, but in 1687 lapsed into a province of the Mogul Empire. In 1713 Asaf Jah, one of Aurangzeb's warriors, was appointed viceroy of the Deccan, with the title Nizam-ul-Mulk (regulator of the state), and eventually made himself independent. After his death, in 1748, the throne was contested by his son, Nazim Jang, supported by the English East India Company, and his grandson, Muzaffar Jang, whose cause was espoused by the French under Duplex. The latter triumphed until Muzaffar Jang was murdered by Patan chiefs. Anarchy reigned until Nizam Ali, who ascended the throne in 1761, was defeated by the British and signed the Treaty of 1766, which ceded the northern Circars to the East India Company. The misrule of Nizam Ali's successors increased the territorial debt, which was liquidated by a further cession of land to the East India Company, with the stipulation that part of the revenues should maintain the Nizam's contingent, a subsidiary force of 8000 men for the protection of his dominions. During the mutiny of 1857 an unsuccessful attack was made on the British Residency at Hyderabad, the Nizam and his troops, however, remained faithful to the British, and the state has since been distinguished for its loyalty to the Imperial power. Usman Ali Khan, the present Nizam, came to the throne in 1911. The most important work of his reign has been the construction of the Musi Reservoir at a cost of \$2,000,000. Consult A Gribble, *History of the Deccan* (London, 1896), and R P MacAuliffe, *Nizam, the Origin and Future of the Hyderabad State* (New York, 1904).

HYDERABAD, or HAIDARABAD. The

capital of the Nizam's Dominions, India. It stands on the right bank of the Musi River, in lat 17° 22' N and long 78° 27' E, 1800 feet above the sea (Map India, D 6). It is the fourth largest city in India, is an important railroad and commercial centre, and its well-stocked and extensive bazars are particularly picturesque. The splendid building of the British Residency stands on the opposite side of the river, the stream being here bridged by nine spacious arches of squared granite connecting the Residency with the Nizam's palace, three other bridges span the river. The city is surrounded by a fortified wall 6 miles in circuit. The most conspicuous building is the principal mosque, fashioned after the model of the Kaaba at Mecca and capable of accommodating 10,000 worshippers, while at the meeting of the four principal streets of the city rises another remarkable edifice, the Char Minar, or College with four minarets, 180 feet high, resting on connected arches, through which run the four converging thoroughfares. Water is supplied from huge tanks, one of which, close to the British cantonment of Secunderabad, measures 3 miles by 2; another is said to be 20 miles round. The city owns its water works and maintains schools, a hospital, and pleasure grounds with a zoological section. Pop. (including Secunderabad, Bolaram, and the Residency Bazars), 1891, 415,039. 1901, 448,466 (the increase being 81 per cent). 1911, 500,623 (116 per cent). In 1901 there were 243,241 Hindus, 189,152 Mohammedans, and 13,923 Christians. The city was founded in 1589 and was first named Bhagnagar. It fell into the hands of the Mughals in 1687 after the storming of Golconda, where it remained until 1724, when the first Nizam declared his independence and established the city as his capital.

HYDERABAD, or **HAIDERABAD**. The chief city of a district of the same name in the Sindh Division Bombay, British India, 4 miles east of the left bank of the Indus (Map India, A 4). The ancient capital of the Sindh Kingdom, its manufactures, including arms of various kinds, lacquered ware, gold and silver articles, and silks, have always been famous. There are three cotton gins. It is an important railway junction and commercial centre. The chief object of interest is the fort commanding the town. It covers an area of 36 acres. A modern section of the town has fine wide streets, public buildings, and a market place. There is a training college for men, one for women, an engineering school, a medical school, and an agricultural school. The cantonments containing model barracks are to the northwest of the town. Pop. 1901, 69,378, 1911, 75,952.

HYDER ALI, hī'der ā'le (more accurately, *Haider 'Ali*) (c 1720-82). Ruler of Mysore and one of the greatest Mohammedan princes of India. Of humble origin, he is said to have been originally a sepoy in the French army, which may explain the friendship which he always felt for the French. He won the favor of the minister of the Rajah of Mysore by the valor which he displayed at the siege of Trichinopoly in 1749 and, by a rapid rise not infrequent in the East, soon became the power behind the throne. Hyder Ali in 1759 dispossessed his master, allowing him, however, to retain his title, while he himself took that of *dawā*, or regent. He then conquered Calicut, Bednor,

Kananur, and other neighboring states, and in 1766 his dominions included more than 84,000 square miles. He waged two wars against the British—in the first of which (1767-69) he was completely successful, although deserted by his confederate Nizam Ali, a former friend of the English—and a treaty of peace was signed under the walls of Madras. According to the terms of this treaty, as he claimed, Hyder Ali asked the English in 1772 to help him against his old foes, the Mahrattas, who had already defeated him in 1764, but his request was refused. When a conflict broke out between the English and the French in 1778, he sought his revenge. With his son, Tipu Sahib, he entered the Carnatic in 1780 and proceeded to devastate it. After inflicting two severe defeats on the English, he was routed by Eyre Coote at Porto Novo. Two years later he died very suddenly. Consult *Le Maître de la Tour, Histoire d'Hyder-Ali Khan* (Paris, 1783). Husein Ali Khan Kirmani, *History of Hydr Arah* (trans by Miles, London, 1842). L B Bowring, *Haider Ali and Tipu Sultan* (Rulers of India Series, Oxford, 1893).

HYDNUM. A genus of fleshy fungi which gives name to the family Hydnaceae, or "tooth fungi." They are so named because the hymenium (qv) covers toothlike or spine-like processes rather than gill-like plates, as in the ordinary mushrooms.

HYDRA, hē'dra or ē'dra (Lat *Hydra*, Gk *Ἥδρα*). An island of Greece, situated 5 miles off the east coast of Morea (Map Greece, D 6). It is about 11 miles long and 3 miles broad and has an area of 22 square miles. The shores are rocky and steep, and the interior rises to a height of 1950 feet. On the north coast is the town and seaport of Hydra, the white, flat-roofed houses of which are ranged on the side of a hill. The streets are steep and uneven, but remarkably clean. It is the seat of a bishop, manufactures cotton and silk goods, leather, ships, and has a good trade. In ancient times the island of Hydra was a dependency of the city of Hermione and was later ceded to the Troezenians. During the fifteenth and sixteenth centuries it was settled by fugitives from Albania, Argolis, and Attica. In the Grecian War of Independence the Hydriotes took a most active part, and none were more liberal in their contributions to the patriotic cause. At the time of the outbreak of the Revolutionary War (1821-29) the islanders were considered the richest in the archipelago, holding the carrying trade of the Black Sea and shipping to England, the Baltic, and even to America. Since the Revolution, however, more accessible ports have risen to be the centres of Greek commerce, and Hydra has greatly declined. Pop. 1907, 5695, almost all concentrated in the town of Hydra.

HYDRA, hī'dra (Lat, from Gk *Ἥδρα*, water snake). A fabulous monster, offspring of Typhon and Echidna, dwelling on a hill near the spring Amymone in the marshes of Leina, near Argos. The hydra had many heads, of which the central one was immortal. The number of heads varies in the stories from 9 to 50, or even 100. In works of art she is shown with from 3 to 12 heads, except in Hellenistic times, when the hydra is often represented as a serpent with a woman's head. Hercules (qv) cut off the heads, while his companion, Iolaus, seared the stumps with a brand, as otherwise two

heads grew wherever one was cut off. The immortal head was buried beneath a huge rock. The hero dipped his arrows in the blood of the hydra and thereby made the wounds which they inflicted incurable. The hydra with its poisonous breath seems a personification of the malarial vapors arising from the swamps of Lerna, with their many springs.

HYDRA (Lat., from Gk. ὕδρα, water snake, Skt., Lith. *udra*, OChurch Slav. *vydra*, OHG. *otter*, Ger. *Otter*, Eng. *otter*, with Gk. ὕδωρ, *hydōr*, water). A minute polyp or hydrozoan, common in still, fresh waters. It possesses a gelatinous, subcylindrical body, which from its contractility undergoes various alterations of form. One end expands into a disk or foot, which adheres to a leaf or twig; while a mouth surrounded by a circlet of tentacles, varying from 5 to 12 or more in number, is at the opposite end. These tentacles are exceedingly contractile; at one moment they are thrown out as long, delicate threads, at the next, drawn up into minute wartlike knobs. Numerous nematocysts are in the surface layer of the body, each one of these containing a long, coiled, barbed thread which is quickly protruded if the animal is irritated. The mouth leads into a capacious cavity, excavated throughout the entire length of the animal, which, exclusive of its tentacles, seldom exceeds three-fourths of an inch. The food of the hydra consists of such minute living organisms as come within the reach of its tentacles, and by these apparently fragile threads, which the animal projects like a lasso, crustaceans, worms, and the like are seized, which would be deemed at first sight superior to their captor in strength and activity. The tentacles, however, exert through the action of the thread cells a powerful benumbing or paralyzing influence. The prey when mastered, but often when still alive, is thrust into the internal cavity, where the nutritive parts are absorbed by the hydra, while the indigestible parts are expelled through the mouth.

HYDRA VIRIDIS.

t, tentacles; a, a bud; a, young hydra, developed from a bud.

Although the hydra is usually found adhering to submerged supports, it is not permanently fixed. It often moves on surfaces under water somewhat after the manner of a leech, and occasionally the disk is protruded above the water and thus acts as a float. Sometimes, especially in the autumn, true reproductive organs may be observed, both male and female organs being usually situated on the same animal. Propagation by gemmation is, however, the most common mode of increase. Minute tubercles appear on the body of the parent animal, which, as they increase in size, gradually become perforated at their free extremity and acquire tentacles. The pedicel by which they originate by degrees becomes thinner and finally gives way, leaving the young hydra perfectly independent. One of the most remarkable points in the history of this animal is its power of being multiplied by mechanical division. If a hydra be cut into two or even more pieces, every one will in time assume the form and functions of the original

animal. Several species of hydra have been described, which differ in size, color, and other respects. Two species are common in America, in still water in nearly all parts of the country. One of these (*Hydra viridis*) is bright green in color, while the other (*Hydra fusca*) is grayish brown. The green hydra is notable because its color is due to the presence of chlorophyll, the coloring matter characteristic of plants. Both may easily be reared in aquariums.

HYDRAGOGUES (from Lat. *hydragogus*, Gk. ὕδραγωγός, water carrier, from ὕδωρ, *hydōr*, water + ἀγωγός, *agōgos*, carrying, from ἄγω, *agein*, to lead). Active purgatives which give rise to large, watery stools. The most important are colocynth, elaterium, gamboge, jalap, croton oil, and scammony. These are all powerful drugs, and their administration requires caution. They are used in general dropsy and serous inflammations.

HYDRANGEA, hī-drān'jé-ā (Neo-Lat., from Gk. ὕδωρ, *hydōr*, water + ἀγγεῖον, *angeion*, pail). A genus of about 25 species of ornamental deciduous shrubs of the family Saxifragaceæ, natives of North and South America, China, and Japan. The flowers are white, pink, or bluish, and small, but are borne in large, showy corymbs or panicles, the exterior flowers of which are sterile. The pink varieties, when grown on some soils, produce bluish flowers. The hardier cultivated hydrangeas are *Hydrangea paniculata*, used as specimens or in

HYDRANGEA.

borders, *Hydrangea arborescens*, and *Hydrangea radiata*. *Hydrangea hortensia otuska* is a rather dwarf variety, which is extensively grown in greenhouses, especially for the Easter trade. This variety is also frequently grown outdoors, but the plants should be lifted with a clump of earth before freezing weather and stored in a frost-proof pit or cellar until spring. Hydrangeas require a rather heavy, rich soil, well manured and well watered. They are propagated for the most part by cuttings and division, but sometimes by seed.

HYDRANT. See WATER WORKS.

HYDRARGYRUM, hī-drār'jī-rūm. See MERCURY.

HYDRARTHROSIS. See DROPSY.

HYDRAS'TINE. See ALKALOIDS.

HYDRAS'TININE. See ALKALOIDS.

HYDRAS'TIS (Neo-Lat., from Gk *ὕδωρ*, *hydōr*, water + *δρᾶν*, *dran*, to act) A genus of plants of the family Ranunculaceae, allied to Anemone, the members of which have flowers destitute of petals and succulent or baccate fruit collected into a head. The only known species, *Hydrastis canadensis*, a perennial herbaceous plant, with tuberous roots, and head of fruit resembling a raspberry, is common in rich moist woods in Canada and among the Alleghanies as far south as the Carolinas. Its root is used for dyeing yellow and also in medicine as a tonic. Yellowroot, orange-root, yellow puccoon, and goldenseal are its American names.

HYDRATE (from Gk *ὕδωρ*, *hydōr*, water) A name applied to substances whose molecules contain either one or more entire molecules of water or, synonymously with the term "hydroxide," to metallic compounds whose molecules contain one or more hydroxyl groups (OH). The question has been discussed, whether substances exist in aqueous solution in the form of 'hydrates' or not, i.e., whether the dissolved molecules are associated into definite groups with those of the solvent, and at the present time it seems almost certain that at least the ions of dissociated acids, bases, and salts are "hydrated" in aqueous solution. Some chemists are inclined to believe that the molecules of even a substance like common sugar are hydrated in solution. The subject is, however, still quite obscure. (See SOLUTION.) A substance containing water of crystallization is sometimes spoken of as a hydrate, and its crystals as hydrated crystals, particularly when they are to be distinguished from the anhydrous crystals of the same substance. On the other hand, chemists often use such terms as potassium hydrate and calcium hydrate in the same sense as they use the terms potassium hydroxide and calcium hydroxide. The hydrates, or hydroxides, of the metals are true chemical compounds. The assumption that substances are *chemically* combined with their water of crystallization, while corroborated by many facts, has not yet been brought into harmony with the doctrine of valency (q.v.), but this only indicates that the doctrine of valency needs modification and extension.

HYDRAULIC PRESS (from Lat. *hydraulicus*, Gk *ὕδραυλικός*, *hydraulikos*, pertaining to the water organ, from *ὕδραυλις*, *hydraulis*, water organ, from *ὕδωρ*, *hydōr*, water + *αὔλος*, *aulos*, pipe) An apparatus for obtaining a heavy pressure for compacting fibrous substances, raising heavy weights, etc., by means of water under pressure. The first design of a working hydraulic press is credited to Joseph Bramah, and for this reason such machines are sometimes called Bramah presses. The operation of the hydraulic press is based upon the principle of hydrostatics that a pressure exerted on any part of the surface of a liquid is transmitted undiminished to all parts of the mass and in

all directions. Thus, if there is a cylinder filled with water in one end of which works a plunger 1 inch square, and in the other end of which works a plunger 12 inches square, and a pressure of one pound be exerted on the smaller plunger, this pressure will be transmitted undiminished by the water, and will exert a total pressure of $1 \times 12 \times 12 = 144$ pounds.

The essentials of a hydraulic press are, therefore, a cylinder containing a small plunger, to which a force is applied, connected by pipe with a cylinder containing a large plunger, which transmits the multiplied pressure to the object to be pressed or lifted. It is evident, furthermore, that the two cylinders may be located any desired distance apart, the only limit being that at which the pipe and cylinder friction reduces the available pressure for performing work below practicable amounts. In modern practice the pressure pump commonly feeds into a hydraulic accumulator (see ACCUMULATOR), and the press cylinder is operated from the accumulator and not directly from the pump. The construction of hydraulic presses varies with the purposes for which they are employed. Hydraulic presses for baling hay and cotton and expressing the oil from seeds, etc., are built substantially as follows. Four iron pillars are erected at the corners of a horizontal square and carry a cast-iron cap rigidly fastened to their tops. The under face of this cap forms the surface against which the material is pressed. At the bottom of the four pillars there is a similar casting which has a circular hole in the centre down through which passes the cylinder casting for the plunger. The plunger has an upward motion in the act of pressing and carries on its top a head or platen consisting of a square casting. The material to be pressed is placed between the lower face of the top casting and the upper face of the platen. Often a boxing is placed around the four sides of the space in which the head moves to prevent the material being pressed from squeezing out laterally. The construction of a press for hydraulic forging differs from the above as follows. The cylinders and plungers are carried by the top casting or column cap, and the plungers work downward in the act of pressing, the bottom casting carries the anvil, the plungers carry a die for the head, and two or more cylinders are provided for raising the plunger and die for a fresh stroke. Generally, also, two pressure plungers and cylinders are employed instead of one. Forging presses are made of all sizes, from that required in pressing out articles like revolver cartridge cases to those used in forging steamship shafts and armor plates. Armor-plate presses having a capacity of 14,000 tons are in use.

HYDRAULIC-PRESSURE ENGINE. A motor in which water is made to do work by means of its pressure only, acting on a piston or plunger reciprocating in a cylinder, or, in some cases, on a revolving piston similar to those employed in a rotary steam engine. In the case of a turbine the pressure of a column of water is, in the first instance, employed in giving motion to the fluid itself, and after this motion has been produced the energy due to it is utilized in doing work. In the case of the pressure engine the only pressure expended in giving motion to the fluid is that needed to make the water follow the piston and escape from the motor, and to secure efficiency this piston should

be as small as practicable. This end is most nearly secured when the pressure is great and the speed of the engine is low. The first pressure engine was designed by Sir William Armstrong (q.v.) and was of the rotary type. This engine was never actually used and was replaced by a reciprocating engine designed by the same engineer. Since Sir William Armstrong's invention a great variety of hydraulic-pressure engines have been invented, the majority of which are of the reciprocating type. Hydraulic-pressure engines are particularly adapted to the use of high-pressure water in comparatively small quantities, and where these conditions prevail they have a considerable field of usefulness, particularly as secondary motors for operating mechanical contrivances, such as the opening machinery for swing bridges, cranes, hoists, etc. Consult: G. R. Bodmer, *Hydraulic Motors, Turbines, and Pressure Engines* (3d ed., New York, 1889); I. P. Church, *Hydraulic Motors with Related Subjects* (ib., 1905); Turneure and Black, *Hydraulic Engineering* (Chicago, 1908). See TURBINE; WATER POWER; WATER WHEEL.

HYDRAULIC RAM. Primarily a device by which the momentum of water flowing by gravity in a pipe is utilized to lift a portion of itself through another pipe to an elevation greater than the source of supply. The flow of water in the main or drive pipe is automatically checked by the closing of a valve at its foot. When the valve is open, the water escapes freely and flows to waste, but very soon a sufficient momentum is attained to close the valve. The confined water then lifts another valve, opening

HYDRAULIC RAM.

into an air chamber mounted over the foot of the drivepipe. The water partially fills this chamber and in so doing compresses the air therein until the pressure in the chamber just balances that of the column of water in the drivepipe. The valve at the foot of the drivepipe then opens, and the process is repeated. The pressure of the compressed air in the air chamber forces the water in the bottom of the chamber out through a small supply pipe to the desired elevation. A snifting valve is provided to supply air to the chambers to make good the losses due to absorption of air by the water. Theoretically 100 gallons of water falling 15 feet would raise 15 gallons 100 feet, and other quantities and heights in like proportion; but some water is wasted during each cycle, and there is more or less friction to be overcome, depending on the design of the ram and the length and diameter of the pipes. An efficiency of 75 per cent would

be high. With the increase in the ratio of the fall of the driving water to the elevation to be overcome, the efficiency decreases, particularly when the ratio exceeds 1 to 12 (i.e., 1 foot fall for 12 feet raised). Where the fall is great, the wear and tear on the ram is excessive. Some authorities give the desirable working limit for a hydraulic ram as $1\frac{1}{2}$ to 10 feet fall of drive water and a lift of not over 250 feet, but with so great a lift a large proportion of the water will be wasted. The ram, as described, was invented by Joseph Michael de Montgolfier, of France in 1796; but in 1772 an Englishman named John Whitehurst built a machine embodying the same principle, except that the valve at the foot of the drivepipe had to be closed by hand. His device was described in the *Philosophical Transactions* for 1775. Many improvements have been made in the machine of Montgolfier, the most important of which, perhaps, aim to lessen the shock of the operation of the valves. Springs have been used to that end; the drivepipe valve has been counterweighted, and a portion of the air compressed in the chamber has been used to drive a small air motor, so connected as to aid in the gentle closing of the valve at each cycle. Another improvement is the equipment of rams so that a supply of dirty water may be used to lift clean water, either when the supply of the latter is scanty or is not available under a sufficient head. Finally, hydraulic rams are used to drive pumps, when they are properly classed under pumping engines. See PUMPS and PUMPING MACHINERY.

HYDRAULICS. See HYDRODYNAMICS; HYDROSTATICS.

HYDRAZINE, or AMIDOGEN, $\text{H}_2\text{N}=\text{NH}_2$. A basic compound of nitrogen and hydrogen, which may be obtained by heating triazo-acetic acid with water. In 1909 Chattaway obtained it from dichloro-urea, which, in turn, may be readily prepared by the action of chlorine upon urea in aqueous solution at low temperatures. Hydrazine hydrate, $\text{N}_2\text{H}_4\text{H}_2\text{O}$, is a strong reducing agent precipitating metallic silver and platinum from solutions of their salts. Under a pressure of 740 millimeters it boils at 118.5°C . (245.3°F). It attacks rubber, cork, and even glass. With acids it forms crystalline salts, such as the hydrochlorides, $\text{N}_2\text{H}_4\text{HCl}$, and $\text{N}_2\text{H}_4\text{H}_2\text{SO}_4$, the sulphate, $\text{N}_2\text{H}_4\text{H}_2\text{SO}_4$, etc. The hydrogen of hydrazine may be partly replaced by either hydrocarbon groups, such as methyl (CH_3), ethyl (C_2H_5), phenyl (C_6H_5), etc., or organic acid radicals, such as acetyl (CH_3CO), benzoyl ($\text{C}_6\text{H}_5\text{CO}$), etc. The most important of these organic derivatives of hydrazine is phenylhydrazine, $\text{C}_6\text{H}_5\text{HN}=\text{NH}_2$. It is prepared by dissolving aniline in strong hydrochloric acid, adding (in the cold) an aqueous solution of sodium nitrite, then further adding a solution of stannous chloride in concentrated hydrochloric acid, allowing to stand for some time, and filtering off the solid phenylhydrazine hydrochloride formed; phenylhydrazine itself is freed from this salt by treatment with caustic potash, extraction with ether, and distillation under reduced pressure. The benzoyl compounds include benzoyl-hydrazine, $\text{C}_6\text{H}_5\text{CO}\cdot\text{HN}=\text{NH}_2$, and symmetrical dibenzoyl-hydrazine, $\text{C}_6\text{H}_5\text{CO}\cdot\text{HN}=\text{NCO}\cdot\text{C}_6\text{H}_5$. The presence of hydrazine in aqueous solutions may be readily detected by the use of a few drops of benzaldehyde, with which it forms a yellow crystalline precipitate of benzalazine, $\text{C}_6\text{H}_5\text{CH}\cdot\text{N}=\text{NH}_2$. Compounds of simi-

lar constitution are formed by the action of hydrazine on other aldehydes. In general the oxygen of the carbonyl group (CO) of an aldehyde or a ketone combines with two hydrogen atoms of many hydrazine derivatives, forming water, while the remaining parts of the reacting substances form what are known as *hydrazones*. For instance, ordinary glucose (an aldehyde) and phenylhydrazine give phenylhydrazone. See DIAZO COMPOUNDS.

HYDRAZONE See HYDRAZINE

HYDRIA, hī'di-a or hid'i-a See VASE

HYDRIDE A name applied, in chemistry, to the compounds of the metals with hydrogen. Notable hydrides are those of palladium, sodium, potassium, calcium, strontium, barium, and magnesium. The hydrides have, at least as yet, no practical value. The term "hydride" was formerly employed in connection with certain hydrocarbons. See HYDROGEN, CALCIUM, ETC.

HYDRIODIC ACID (from *hydro*-gen + *iod*-ine), HI. An acid compound of hydrogen and iodine, analogous to hydrochloric acid. It may be prepared by the action of phosphoric acid on potassium iodide. More usually it is made by the action of water upon a mixture of iodine and red phosphorus. A pure aqueous solution of hydriodic acid may best be prepared by dissolving a quantity of iodine in carbon disulphide, covering the solution with a layer of water, and introducing a stream of sulphureted hydrogen gas. When the iodine is entirely transformed into hydriodic acid, the aqueous layer is removed and boiled for a few minutes to remove the excess of sulphureted hydrogen. In the presence of catalytic agents, particularly platinum black, hydrogen and iodine unite into hydriodic acid gas directly, and at higher temperatures even the catalytic agent is not necessary, the union of the elements proceeding rapidly enough without it. However, whether a catalyzer is present or not, the union of hydrogen and iodine is never complete, a state of chemical equilibrium being established when a certain proportion of the elements has entered into combination. (See REACTION, CHEMICAL.) In its isolated state hydriodic acid is a colorless gas with an odor resembling that of hydrochloric acid. Usually it is kept in aqueous solution and is thus employed in a number of chemical processes. It decomposes somewhat easily into its components, hydrogen and iodine, and by giving up its hydrogen acts as a reducing agent. The salts of hydriodic acid are termed *iodides* (qv). Hydriodic acid is sometimes used medicinally instead of its salts.

HYDRIOTAPHTA, or **URN BURIAL**. A quasi-scientific, quasi-religious treatise by Sir Thomas Browne (1658). Its explanatory subtitle is *A Discourse of the Sepulchral Urns Lately Found in Norfolk*.

HYDROAEROPLANE, hī'drō-ā'ēi-ō-plān See AERONAUTICS

HYDROBROMIC ACID (from *hydro*-gen + *brom*-ine), HBr. An acid compound of hydrogen and bromine, analogous to hydrochloric acid. It may be prepared by the action of bromine upon red phosphorus placed in water, or by covering a mass of bromine with a layer of water and passing a stream of sulphur dioxide into the aqueous layer, when the bromine has disappeared, the aqueous solution is purified by distillation. In the practice of the organic laboratory hydrobromic acid is obtained as a

by-product in the bromination of aromatic hydrocarbons, e.g., in making bromobenzene by the action of bromine upon benzene in the presence of iron or some similar catalyzer. In the isolated state it is a colorless gas with an odor resembling that of hydrochloric acid. Like the latter, it is very soluble in water, the solution being sometimes used in synthetic chemistry. The salts of hydriobromic acid are termed *bromides* (qv).

HYDROCARBONS (from *hydro*-gen + *carbon*) A class of chemical compounds containing only carbon and hydrogen. Their commercial value is very considerable, inasmuch as they form the principal ingredients of petroleum, illuminating gas, caoutchouc, gutta serena, essence of turpentine, etc. They are the simplest of the compounds of carbon, and the fundamental ideas of organic chemistry have been derived largely from a careful study of their properties and reactions. They are obtained when various organic substances are subjected to a process of destructive distillation and are subdivided principally into *aliphatic*, or fatty, *aromatic*, and *hydroaromatic* hydrocarbons.

Fatty Hydrocarbons These form an important class and are subdivided into the paraffin, olefin, and acetylene series.

1 *The Paraffins*, or saturated hydrocarbons of the methane series, are very stable compounds and do not react even with the strongest acids and alkalis, hence their name, "paraffins," derived from the Latin *parum affinis*, which means 'having little affinity.' Large quantities of them occur in nature as petroleum, natural gas, ozokerite, etc. They are also obtained by the destructive distillation of coal, cannel, shale, etc. When they are arranged in the order of their molecular weights, the following "homologous series" is obtained:

Methane,	CH ₄ ,	molecular weight 16
Ethane,	C ₂ H ₆ ,	molecular weight 30
Propane,	C ₃ H ₈ ,	molecular weight 44
Butane,	C ₄ H ₁₀ ,	molecular weight 58
Pentane,	C ₅ H ₁₂ ,	molecular weight 72
Hexane,	C ₆ H ₁₄ ,	molecular weight 86
Heptane,	C ₇ H ₁₆ ,	molecular weight 100, etc

The difference in molecular weight between any two consecutive members of the series is evidently the same. It amounts to 14, the sum of the "weights" of one carbon atom (which is 12) and two hydrogen atoms (which is 2). To obtain the formula of any member, we may substitute a methyl group, CH₃, in place of a hydrogen atom in the member immediately preceding it. Thus, by substituting CH₃ in place of one H in ethane, C₂H₆, we get propane, C₃H₈, or C₂H₅CH₃. The transformation of ethane into propane may be actually effected as follows. First, mono-iodo-ethane (C₂H₅I) is obtained by substituting one iodine atom in lieu of one atom of hydrogen in ethane (C₂H₆), then mono-iodo-ethane is treated with methyl iodide (CH₃I) and metallic sodium. The iodine is thus all removed, and the remaining C₂H₅ group unites with the CH₃ group to form the compound propane (C₂H₅CH₃ or C₃H₈).

The first four members of the above homologous series are liquefiable gases, and each member is more easily liquefied than the one preceding it, the next 11 members are ordinarily liquids, each having a higher *boiling point* than the one preceding it. Finally, the higher members are ordinarily solids, each having a higher *melting point* than the one preceding it. The

lower members burn with a pale, scarcely luminous flame, the higher members give a bright light, and paraffin wax, which is a mixture of solid paraffin hydrocarbons, is used for the manufacture of candles. The paraffins are all colorless, chemically inert, and insoluble in water.

The composition of any single paraffin hydrocarbon is expressed, of course, by its own molecular formula. Thus, the formula C_2H_6 shows the chemical composition of ethane, the formula C_3H_8 shows the composition of propane, etc. On the other hand, the composition of the paraffin hydrocarbons in general is expressed by a *typical formula*, in which algebraic symbols stand for the numbers of atoms of the component elements. This typical (general) formula is C_nH_{2n+2} . The formula permits us to calculate the number of hydrogen atoms in any one of the members of the above homologous series, if the number of its carbon atoms is given. Thus, if $n = 1$, then $2n + 2 = 4$, and C_nH_{2n+2} becomes CH_4 (the formula of methane). The highest member of the series that is actually known to chemists contains 60 carbon atoms, and hence, the typical formula tells us, the number of hydrogen atoms in the molecule of that hydrocarbon (called *hexacontane*) is $2n + 2 = 2 \times 60 + 2 = 122$, and its molecular formula is therefore $C_{60}H_{122}$. It is a well-known fact that compounds exist which have the same chemical composition and yet differ in their physical and chemical properties. Such compounds are termed *isomeric*, and their mutual relations are explained on the assumption that the atoms in their molecules, though the same in kind and number, are differently *grouped*. In the above homologous series the first three members have no such isomers, i.e., only one variety of each could be obtained, the fourth member, butane, has two isomers (called butane and isobutane), the fifth member, pentane, has three isomers, the sixth, hexane, has five isomers, etc. The higher the molecular weight, the greater the number of isomeric formulas which could be constructed according to the structural theory. Not all of these theoretically possible hydrocarbons have been actually prepared in the laboratory. Most of them have no practical value and are interesting only inasmuch as they go to prove the validity of the "structural theory" of compounds, but the number of cases of isomerism in which the theory has been found to hold true is so great that chemists are no longer desirous of obtaining new proofs by artificially producing all of the possible isomeric compounds. See CARBON COMPOUNDS.

2 *The Olefins*, or hydrocarbons of the ethylene series, have the characteristic property of directly taking on bromine and other elements to form *additive* products. This shows that the combining capacity of the carbon contained in them is not completely satisfied by their hydrogen, so they are said to be "unsaturated compounds."

When arranged in order of their molecular weights, they form the following homologous series:

Ethylene,	C_2H_4 ,	molecular weight 28
Propylene,	C_3H_6 ,	molecular weight 42
Butylenes,	C_4H_8 ,	molecular weight 56
Amylenes,	C_5H_{10} ,	molecular weight 70
Hexylenes,	C_6H_{12} ,	molecular weight 84, etc

In this series, again, each member contains one carbon and two hydrogen atoms more than the member immediately preceding it, i.e., the dif-

ference in molecular weight between any two consecutive members of the series amounts to 14. Here, too, as in the paraffin series, a certain regularity is found in the variation of the physical properties of the compounds on passing up the series. The first four members are gases, and each one is more easily liquefied than the one preceding it. Hexylene and the following 13 members are liquids, each one boiling at a higher temperature than the one preceding it. The higher members are solids, and each one has a higher melting temperature than the one preceding it. The olefins are colorless and insoluble in water. They contain a high percentage of carbon and burn with a luminous flame.

The composition of *all* the olefins is expressed by the typical formula of the series, C_nH_{2n} . The ratio of the numbers of hydrogen and carbon atoms is the same throughout the series, showing that the different members of the series have all the same percentage composition. They are, however, not isomeric, in the ordinary sense of the term, for their molecules evidently contain different numbers of atoms. Thus, ethylene (C_2H_4) contains two carbons and four hydrogens, propylene (C_3H_6), three carbons and six hydrogens, etc. But, beginning with butylene, each single member represents several compounds which must be considered as isomeric, since they have precisely the same molecular composition and yet differ in their properties. The structural theory lets us foresee the existence of three isomeric butylenes, five amylenes, 13 hexylenes, etc. Again, as in the paraffin series, the higher the molecular weight, the greater the number of isomers possible, according to both theory and experience.

Hydrogen, particularly in the presence of a catalyzer, like platinum black, adds itself to the olefins (unsaturated), yielding hydrocarbons of the paraffin series (saturated).

Another interesting group of unsaturated hydrocarbons have come into prominence in recent years. The best-known examples of these are triphenylmethyl and triphenylmethyl. In these the atom of carbon is not quadrivalent, as usual, but *trivalent*. See VALENCY.

3 *The Acetylene Hydrocarbons*, when arranged in the order of their molecular weights, form the following homologous series:

Acetylene,	C_2H_2 ,	molecular weight 26
Allylene,	C_3H_4 ,	molecular weight 40
Crotonylene,	C_4H_6 ,	molecular weight 54, etc

Like any other homologous series, the acetylene series presents a certain amount of regularity in the variation of the physical properties of the compounds with increase of their molecular weight.

The acetylenes are unsaturated, in fact, they are *doubly* unsaturated compounds (see ACETYLENE), as is shown by their capacity for taking on bromine and other elements to form additive products. The acetylene hydrocarbons burn with a very smoky flame, unless by some method enough oxygen is supplied to burn up completely the large amount of carbon they contain. The general formula of the series is C_nH_{2n-2} . Nascent hydrogen adds itself to the acetylene hydrocarbons, yielding still unsaturated hydrocarbons of the ethylene series.

Aromatic Hydrocarbons. The principal groups into which these hydrocarbons are subdivided include the *Benzene series*, the *Naphthalene series*, and the *Anthracene series*. The

typical formulas representing these three series are, respectively, C_nH_{2n-6} , C_nH_{2n-12} , and C_nH_{2n-18} . Other hydrocarbons, not included in these series, are represented by the formulas C_nH_{2n-8} , C_nH_{2n-10} , C_nH_{2n-14} , C_nH_{2n-20} , etc., but these are not important enough to be discussed here. The most important members of the benzene series are benzene (C_6H_6), toluene (C_7H_8), and xylene (C_8H_{10}). The most important substance of the naphthalene series is naphthalene itself ($C_{10}H_8$), that of the anthracene series, anthracene ($C_{14}H_{10}$). All these are described in special articles. Suffice it to mention here that the chief source of aromatic hydrocarbons is the coal tar (qv) obtained as a by-product in the manufacture of coal gas, and that it is principally from these hydrocarbons that innumerable artificial dyes, drugs, etc., are now made on an industrial scale.

Hydroaromatic Hydrocarbons. These bear the same relation to the aromatic hydrocarbons as the paraffins bear to the olefins (see above), in other words, they may be considered as derived from the aromatic hydrocarbons by the addition of hydrogen. As a matter of fact, they are in most cases most readily prepared by treating the corresponding aromatic hydrocarbons with hydrogen gas in the presence of finely divided metallic nickel, a catalyzer introduced by Sabatier and Senderens. They are mobile, colorless liquids, volatile, and having an odor resembling that of printer's benzine on the one hand and that of camphor or peppermint oil on the other hand. They are much more stable than the aromatic hydrocarbons and are altogether similar to the fatty hydrocarbons in chemical behavior. Thus, strong nitric acid has no effect on them under conditions where an aromatic hydrocarbon would be readily nitrated. On the other hand, *dilute* nitric acid attacks them, according to Konovaloff, at the boiling temperature of water. One of the best-known members of the series is cyclohexane, or hexahydrobenzene, C_6H_{12} . The derivatives of the hydroaromatic hydrocarbons include such important substances as the terpenes (qv) and the camphors.

The hydrocarbons should not be confounded with the carbohydrates, like sugar, starch, or cellulose, which contain, besides carbon and hydrogen, also oxygen. See CARBON COMPOUNDS, GRIGNARD REACTION, VALENCY.

HYDROCELE (Lat., from Gk *ὕδρωκέλη*, *hydroskēlē*, from *ὕδωρ*, *hydōr*, water + *κέλη*, *kēlē*, tumor). The medical term for dropsy of the tunica vaginalis, a serous membrane or sac investing the testes. Hydrocele occurs as a smooth, pear-shaped swelling, fluctuating when pressed, devoid of pain or tenderness, but sometimes causing a slight uneasiness from its weight. The quantity of serous fluid in the sac is usually from 6 to 20 ounces, but it occasionally exceeds 100 ounces. Hydrocele may occur as a result of acute inflammation, but it most commonly comes on without any apparent local cause. It is most frequently met with about or beyond the middle period of life, and generally in persons of feeble power or with a tendency to gout, sometimes, however, it occurs in young children, either in the same form as in adults, or as what is termed *congenital hydrocele*, when the communication between the tunica vaginalis and the abdominal peritoneum is not obliterated, as it normally should be. Palliative treatment consists in the use of suspensory bandages,

strapping, and tapping with a fine trocar. Tapping seldom gives more than temporary relief, the swelling usually regaining its former bulk in three or four months. A cure is sometimes effected after tapping by the injecting of irritating substances, such as tincture of iodine and carbolic acid. The only certain method of cure, however, consists in excision of the tunica vaginalis.

HYDROCEPHALUS (Neo-Lat., from Gk *ὕδροκέφαλον*, *hydroskephalon*, water in the head, from *ὕδωρ*, *hydōr*, water + *κεφαλή*, *kephalē*, head). A collection of serous fluid in the cranium. If it is within the ventricles of the brain, the condition is known as *internal hydrocephalus*, if beneath the arachnoid membrane, *external hydrocephalus*. The disease may be *primary*, being then usually tuberculous in origin, or it may follow some other disease, in which case it is termed *secondary*. Three types—the *acute*, the *chronic*, and the *congenital*—are described. Hydrocephalus may occur in children or in adults as a secondary lesion resulting from meningitis. In such cases, the bones of the skull having united, there is much less opportunity for distention.

Acute Hydrocephalus. This is usually a sudden disease, marked by an acute collection of fluid within the skull, internal or external to the brain ventricles. It may be primary or secondary to such diseases as whooping cough, heart disease, rachitis, tumors within the skull cavity, or acute fevers, such as pneumonia or typhoid. The symptoms are various, much depending on its cause. The most characteristic symptoms are those due to the pressure on the brain. In addition to the enlargement of the head there may be much restlessness, inability to sleep, nausea and vomiting, paralysis or convulsions. The pupils are apt to be unequal and sluggish. In the severer cases pressure upon the brain causes death. See MENINGITIS.

Chronic Hydrocephalus. This may follow an acute attack, or the disease may begin very insidiously. The symptoms again are those due to pressure. The fontanels in the skull are apt to bulge, the eyeballs protrude somewhat, the blood vessels on the outside of the head are apt to be swollen and prominent. Headache is common. A peculiar sidewise shifting movement of the eye, termed nystagmus, is very constant, and crossed eyes are not uncommon. There is usually much restlessness, and if the patients live they are apt to be dull mentally or idiotic. Some of these patients live to middle age, but most of them die young. The treatment requires the greatest medical and surgical skill.

Congenital Hydrocephalus. The distention may be so slight at birth as to be scarcely evident, or the distention may be considerable or so advanced as to preclude the birth of a living child. After birth the progress of the disease may be gradual or rapid. The lateral ventricles usually show the greatest distention, although all the ventricles may be involved as well as the central canal of the cord. The condition of the brain tissue depends entirely upon the amount of pressure. It may be little different from normal, or the convolutions may be flattened, or the hemispheres may be reduced to a thin layer under the dura mater. The brain tissue itself is apt to be soft and flabby, and the base of the brain is usually less affected than the hemispheres. The openings between the bones of the skull are large in size, the bones thin and tend-

ing to bulge forward, making the forehead prominent

A few rare cases of spontaneous cure of hydrocephalus have been reported, following the accidental discharge of the cerebrospinal fluid. Surgical measures are occasionally successful in arresting or curing the affection. In young children having internal hydrocephalus a fine aspirating needle may be thrust through the coronal suture into one of the ventricles, and the cerebrospinal fluid evacuated. The latest surgical procedure is to trephine at the vertex of the skull and insert a specially devised trocar between the hemispheres of the brain, through the corpus callosum and so into the lateral ventricle. By this method a free communication is established between the internal and external cerebrospinal cavities, and pressure equalized.

HYDROCHARITACEÆ A family of aquatic monocotyledonous plants. It is known as the "frog's bit" family and includes not only the frog's bit (*Lumnobium*), but also "water weed" (*Elodea*) and "tape grass," or "eel grass" (*Vallisneria*, q.v.)

HYDROCHLORIC ACID (from *hydro*-gen + *chlor*-ine), or **MURIATIC ACID**, HCl. A gaseous compound of hydrogen and chlorine, the aqueous solution of which is extensively used in the arts. It was known to the alchemists, who refer to it as *spiritus salis*; Glauber isolated it in the form of a pure aqueous solution about the middle of the seventeenth century by treating common salt with sulphuric acid. Priestley obtained it in the gaseous state and called it *marine acid air*. Lavoisier introduced the view that all acids necessarily contain oxygen, and hence hydrochloric acid was for years believed to contain oxygen. About 1810 Davy had established the elementary nature of chlorine, and hence the true nature of its hydrogen compound—hydrochloric acid, and within 10 years the correctness of his results became generally recognized. (See **CHEMISTRY**.) Hydrochloric acid occurs in the exhalations from active volcanoes, especially from Vesuvius and the fumaroles of Hecla. It is also a constituent of the waters of certain South American rivers that have their source in the volcanic districts of the Andes. Also it is a constituent of the gastric juices of man and animals and plays an important part in the digestive process. When sodium chloride (common salt) is decomposed by heating with sulphuric acid, as in the Le Blanc process for making soda, sodium sulphate ("salt cake") remains behind, while gaseous hydrochloric acid is evolved. The acid was formerly allowed to pass off into the air, and naturally had an injurious effect on vegetation in the vicinity of the manufacturing establishments. At present the acid vapors are carefully collected, and hydrochloric acid constitutes an important by-product of the manufacture of soda.

Hydrochloric acid is a colorless gas with a pungent odor and taste, and fuming strongly in the air. It is extremely soluble in water. On the application of pressure and cold the gas can be condensed to a colorless liquid; but the commercial product is usually dissolved in water. It is the strongest acid known, and accordingly its aqueous solution is an excellent conductor of electricity. The commercial acid is generally colored by the presence of some iron, it also usually contains arsenic and sulphuric acid, from all of which impurities it may be freed by distillation. The acid is used

in preparing the chlorides of various metals, for extracting phosphates from bones, in dyeing and tissue printing, and in the manufacture of coal-tar colors. For works on hydrochloric acid, consult the various books on the manufacture of soda.

Chlorides. The salts of hydrochloric acid are termed chlorides. By far the most important of these is the chloride of sodium, or common salt, which is described in a special article. Very similar to it is the chloride of potassium, KCl, which occurs extensively (combined with magnesium chloride) in the mineral carnallite, at Stassfurt in Germany, and in smaller quantities in sea water. It is manufactured from carnallite and is purified by recrystallization from water. The chloride of aluminium, Al_2Cl_6 , is obtained by treating aluminium oxide with charcoal in a current of chlorine, or by passing a stream of chlorine gas over heated metallic aluminium. It is readily soluble in water, alcohol, and ether, but in aqueous solution it is hydrolyzed to a considerable extent, and the free hydrochloric acid in its solution may be driven off, leaving behind aluminium hydroxide. Aluminium chloride is largely used in organic chemistry in the so-called Friedel and Crafts reaction. See **FRIEDEL**. For other chlorides, see **BARIUM**, **CALOMEL**, **GOLD**, **MANGANESE**, **MERCURIC CHLORIDE**, **SAL AMMONIAC**. See also **BLEACHING POWDER**.

HYDROCORALLINA (Neo-Lat., from Lat. *hydra*, water snake + *corallinus*, coral red, from *corallum*, coral). An order of Hydromedusæ, including the important Paleozoic family Stromatoporidae. See **CELENTERATA**, **HYDROZOA**.

HYDROCYANIC ACID (from *hydro*-gen + *cyan*-ogen), HCN. A chemical compound, often called *prussic acid* from its having been first obtained by Scheele in 1782 from the substance known as Prussian or Berlin blue. Hydrocyanic acid is of equal interest to the chemist, the physician, and the toxicologist. The pure anhydrous acid is a limpid volatile liquid of a strong, penetrating odor resembling that of peach blossoms or oil of bitter almonds. At low temperatures it solidifies to a crystalline mass that melts at -15°C , at 18°C it has a specific gravity of 0.697, and it boils at 26°C (78.8°F). Its volatility is so great that if a drop be allowed to fall on a piece of glass part of the acid becomes frozen through the cold produced by its own evaporation. It burns with a pale-blue flame, reddens litmus paper slightly (its acid properties being feeble), and is very soluble in water and in alcohol. In the anhydrous state it is not affected either by the action of air or by that of light. In the presence of moisture, however, it is decomposed, with formation of a brown substance known as azulmic acid. If its aqueous solution is exposed to light, decomposition rapidly takes place, with formation of a number of different substances, including ammonia, formic and oxalic acids, etc.

Hydrocyanic acid is made by heating yellow prussiate of potash (potassium ferrocyanide) with dilute sulphuric acid, the reaction taking place according to the following chemical equation

In this manner a more or less dilute solution of hydrocyanic acid is obtained, and by fractional distillation and drying over calcium chloride the anhydrous acid may be prepared. An aqueous solution of hydrocyanic acid may also be obtained by shaking silver cyanide with dilute hydrochloric acid. Hydrocyanic acid occurs, both free and in combination, in various plants, and it is readily produced by macerating bitter almonds or cherry kernels with water. Bitter almonds, as well as many other vegetable products, contain a glucoside called *amygdalin* and a peculiar unorganized ferment, or enzyme, called *emulsin*. When brought into contact with water, the amygdalin is acted on by the emulsin, hydrocyanic acid being formed along with other substances, according to the following equation

Amygdalin

Hydrocyanic

Benzal-

Glucose

The dilute acid of the United States Pharmacopoeia contains 2 per cent by weight of anhydrous hydrocyanic acid, while what is known as "Scheele's Prussic Acid" contains from 4 to 5 per cent of the absolute acid. The presence of hydrocyanic acid in solutions may be best proved by one of the following methods

1 To the solution in which the presence of hydrocyanic acid is suspected, caustic potash is added to strongly alkaline reaction, then a few drops of ferrous sulphate are added, and heat is applied, the solution is now acidified with hydrochloric acid, and some ferric chloride is added. If hydrocyanic acid was present in the original solution, a precipitate of Prussian blue, or at least a blue coloration, is produced.

2 A few drops of ammonium sulphide are added to the suspected liquid, and the mixture is evaporated on the water bath, the dry residue is moistened with ferric chloride, when, if hydrocyanic acid was present in the original solution, an intense red coloration is produced

The quantity of hydrocyanic acid in a solution may be determined by adding to the latter a solution of silver nitrate, separating the precipitated cyanide of silver by filtration, washing, drying, and weighing. The amount of hydrocyanic acid may be readily calculated from the weight of silver cyanide found.

We are indebted to the Italians for the introduction of hydrocyanic acid in the *matéria medica*. There are no cases in which it is so serviceable as in those affections of the stomach in which pain is a leading symptom, as in gastrodynia, water brash, and in cases of intense vomiting. It is also useful in allaying spasmodic cough and has been employed with advantage in chronic skin diseases, to allay pain and irritation, no matter what the cause. A mixture of one part of the dilute acid (of 2 per cent strength) with about 48 parts of water forms a good lotion.

Hydrocyanic acid is one of the most energetic poisons known. A single drop of the pure acid causes instant death if placed inside the eye. When a small poisonous dose (about half a dram of the 2 per cent acid) has been taken, the first symptoms are weight and pain in the head, with confusion of thought, giddiness, nausea (and sometimes vomiting), a quick pulse, and loss of muscular power. If death result, this is preceded by tetanic spasms and involuntary evacuations. When a large dose has been taken (as from half an ounce to an ounce of the 2 per cent acid), the symptoms may commence

instantaneously, and it is seldom that their appearance is delayed beyond one or two minutes. The patient is insensible, his eyes are fixed, the pupils are dilated and unaffected by light, the limbs are flaccid, and the skin is cold and clammy, the respiration is slow and convulsive, and the pulse is imperceptible.

Hydrocyanic acid causes paralysis of the heart, of the respiratory centre, and of the vasomotor centre in the medulla. The spinal cord, too, is paralyzed shortly before death. The immediate cause of death is in most cases obstruction of the respiration, but in some cases it lies in stoppage of the heart's action.

Where the fatal action is so rapid, antidotes are of comparatively little value. Chlorine, ammonia, peroxide of hydrogen, cold affusion, artificial respiration are the most important agents in the treatment. Cold affusion on the head, neck, and down the spine is a valuable remedy, and it is asserted that its efficacy is almost certain when it is employed before the convulsive stage of poisoning is over, and that it is often successful even in the stages of insensibility and paralysis. One-fiftieth gram of atropine should be injected subcutaneously. Artificial respiration should never be omitted.

Among the compounds of hydrocyanic acid may be mentioned the cyanides of potassium and mercury. The more important ferrocyanides and ferricyanides are described in the articles on hydroferrocyanic and hydroferricyanic acids (qqv).

Potassium cyanide is an extremely poisonous white crystalline substance, soluble in water, but insoluble in absolute alcohol. It may be melted without undergoing chemical decomposition, its aqueous solutions, however, readily decompose on boiling. It is made on a large scale by heating yellow prussiate of potash (potassium ferricyanide), the decomposition of the latter taking place according to the following equation

Potassium ferrocyanide

Potassium
cyanide

Iron
carbide

The cyanide is separated from the carbide of iron formed along with it, by filtering through hot porous crucibles. Potassium cyanide is largely employed in extracting gold and in electroplating. In the molten state it acts as a powerful reducing agent, readily setting free metals from their oxides, e.g., lead oxide is reduced by it according to the following equation

A double cyanide of potassium and sodium, $K_2Na(CN)_3$, is made by melting potassium ferrocyanide with metallic sodium and, after cooling, extracting the product with water and evaporating the aqueous solution.

Mercuric cyanide, $\text{Hg}(\text{CN})_2$, may be obtained by heating potassium ferrocyanide with mercuric sulphate in water, or by dissolving mercuric oxide in aqueous hydrocyanic acid. It is a colorless substance of a bitter metallic taste and is moderately soluble in water and in alcohol. When heated, it decomposes into metallic mercury and cyanogen gas. It is very poisonous, but is, in highly dilute solution, sometimes useful in syphilis and in diphtheria.

HYDRODICTION, hī'drō-dik'ti-ōn. A genus of green algæ (Chlorophyceæ, q v), whose species are called "water nets." The hollow

"net" constitutes one of the most remarkable of plant colonies, floating freely, and sometimes attaining a length of a foot or more. It is formed by an end-to-end union of long cylindrical cells (each of which is an independent one-celled plant) in such a way as to form polygonal meshes, three or four cells abutting at each junction.

HYDRODYNAMICS (from Gk *ὕδωρ*, *hýdōr*, water + *δύναμις*, *dýnamis*, power, from *δύνασθαι*, *dýnasthai*, to be able). Strictly speaking, that branch of mechanics which is the application of dynamics to liquids, it should therefore include both the statics and the kinetics of liquids, i.e., a study of their properties both when they are in equilibrium and when not. In general, however, the former phenomena are treated separately under hydrostatics (*qv*), leaving for hydrodynamics simply the phenomena of kinetics. Further, although gases are easily compressed, while liquids are not, yet, if a gas is flowing slowly and without great fluctuations, it will have properties closely resembling those of a flowing liquid. Consequently hydrodynamics also includes most of the phenomena of the kinetics of gases. If a liquid is flowing regularly through a tube of an irregular cross section, or if a gas is flowing slowly and regularly through such a tube, the mass of the fluid which passes each point in the tube in a given time must be the same; otherwise there would be a state of compression or rarefaction somewhere in the tube, it follows, then, that where the tube is narrow the velocity must be large, and conversely, like a river flowing first through a lake and then through a narrow channel. If the velocity at any point in the tube is greater than at another, it shows that there must be a force acting in the direction from the second point towards the first, so as to increase the velocity of the moving fluid, but the force must always be produced by a fall in pressure, and so the pressure at the second point is greater than at the first. It follows, then, that in a fluid flowing in a *steady state* where the velocity is small the pressure is large, and conversely if friction is supposed to be excluded. This general principle is illustrated by the "ball nozzle," the injector of a boiler, the common atomizer, the "ball in the fountain" experiment, and many others. If a fluid is flowing through a long pipe, e.g., water or gas in city mains, there is of course always a great amount of friction between the moving fluid and the layer that sticks to the tube. Owing to this, the pressure decreases along the pipe, and the velocity of flow is decreased also.

If an opening is made in the side of a vessel containing a liquid, the latter will make a jet out into air. If the opening is a small one in a *thin* wall, it may be observed that the cross section of the jet a short distance from the wall is less than that of the opening itself; this place of smallest cross section is called the "vena contracta." If a quantity of liquid of mass m escapes, having a velocity v , its kinetic energy is $\frac{1}{2}mv^2$. This energy is evidently due to the fact that the effect inside the vessel is just as if these m grams had been taken off from the free surface, and so, if the centre of the opening is at a depth h below the free surface, the m grams have lost an amount of potential energy mgh . Therefore

$$mgh = \frac{1}{2}mv^2, \text{ or } v^2 = 2gh$$

This value of the velocity of efflux was first

deduced by Torricelli, the pupil of Galileo. This theorem may be stated in a slightly different way. The liquid is forced out owing to a difference of pressure on the two sides of the opening equal to ρgh . (See **HYDROSTATICS**.) Calling this difference of pressure P , the formula for v becomes

$$v^2 = 2 \frac{P}{\rho}$$

In this form it may be applied to the rate of escape of a gas from a vessel through a small opening in a thin wall. It is seen that the square of the velocity of efflux varies inversely as the density of the gas and directly as the pressure forcing the gas out, i.e., as the difference of the *partial* pressures of that particular gas on the two sides of the opening, regardless of what other gases are present or what their pressures are. (See **DIFFUSION**.) If the escape of the fluid takes place through a thick wall or through a tube, the phenomena are entirely different, owing to friction. It is observed that the rate of escape is independent—within certain limits—of the material of the tube, showing that there is a layer of the fluid adhering to the inner walls of the tube, thus forming a tube of the fluid through which the flow takes place. The following formula has been found by experiment to hold approximately for capillary tubes

$$v = \frac{Pr^2}{6\eta l},$$

where r is the internal radius of the tube, l is its length, and η is a constant.

If an obstacle is placed in a stream of liquid or of gas, it experiences certain forces. One of the most interesting cases is that of an oblong solid in a fluid stream, it will tend to place itself with its length at right angles to the current. This is illustrated by the fact that when a small piece of paper falls it does not do so edge down, but face down, if a coin is dropped in water, it falls face down, "wobbling" as it sinks. (See **PROJECTILE**.) Other cases of fluid motion are too difficult for discussion here. It should be noted, however, that there are two great divisions of such motions, irrotational and rotational. The former is such that, if a small portion of the fluid were suddenly solidified and freed from the rest of the fluid, it would have simply motion of translation, no rotation. The latter is such that, if a small portion of the fluid were suddenly solidified and freed from the rest of the fluid, it would be spinning round a definite axis. It was proved theoretically by Lagrange that, if a certain portion of a perfect fluid free from viscosity were set in irrotational motion, it would never have its character changed (if certain conditions are satisfied, as they would be in general). Helmholtz has proved, further, that, if a portion of a perfect fluid is moving rotationally, it will always do so, and that it is as impossible to produce this motion in a perfect fluid as it is to destroy it. He showed, too, how lines can be imagined drawn in the fluid so that at each of their points they coincide with the axis of rotation of the portion of fluid at that point. Such a line is called a vortex line, and a "solid" tube made up of such lines is called a vortex. A vortex once existing in a perfect fluid moves through it, keeping its identity, i.e., always being made up of the same particles and preserving certain

other properties. If two vortices were to collide, they would rebound, being perfectly elastic. Many of the properties of vortices can be imitated by smoke rings, but the air is, of course, not a perfect fluid, and so the vortices do not persist. Consult Basset, *Treatise on Hydrodynamics* (Cambridge, 1888), G. G. Stokes, *Mathematical and Physical Papers* (5 vols, New York, 1880-1905); A. G. Webster, *Dynamics of Particles and of Rigid, Elastic, and Fluid Bodies* (1b, 1904); Horace Lamb, *Hydrodynamics* (3d ed, 1b, 1906).

HYDROELECTRIC DEVELOPMENT See WATER POWER AND WATER DEVELOPMENT

HYDROELECTRIC PLANTS. See WATER-POWER PLANTS

HYDROFERROCYNANIC ACID (from *hydro-gen* + *ferricyanic*), $\text{H}_3\text{Fe}(\text{CN})_6$. A brown crystalline substance obtained by decomposing potassium ferricyanide with dilute mineral acids in aqueous solution.

Potassium ferricyanide, or red prussiate of potash, $\text{K}_3\text{Fe}(\text{CN})_6$, is a dark-red soluble crystalline salt obtained by passing chlorine gas into solutions of potassium ferrocyanide (see **HYDROFERROCYNANIC ACID**), the transformation of the latter taking place according to the following chemical equation:

Potassium ferricyanide is used principally for making *Turnbull's blue*, or ferrous ferricyanide, $\text{Fe}_3[\text{Fe}(\text{CN})_6]_2$, which is prepared by mixing potassium ferricyanide with ferrous salts in aqueous solution.

HYDROFERROCYNANIC ACID (from *hydro-gen* + *ferricyanic*), $\text{H}_3\text{Fe}(\text{CN})_6$. A white crystalline substance readily soluble in water and in alcohol. If exposed to the air, it soon assumes a blue coloration. It may be obtained in the free state by decomposing an aqueous solution of its potassium salt with dilute mineral acids.

The ferrocyanide of potassium, $\text{K}_4\text{Fe}(\text{CN})_6 + 3\text{H}_2\text{O}$, often called yellow prussiate of potash, is a yellow crystalline substance produced when a solution of potassium cyanide is boiled with ferrous hydroxide, the reaction taking place according to the following chemical equation:

On a large scale potassium ferrocyanide was formerly made from animal refuse, such as dried blood, hair, horn shavings, etc. These products were charred and then heated to a high temperature with scrap iron and crude potash. By this process the potassium carbonate contained in crude potashes combined with the carbon and nitrogen of the refuse, yielding potassium cyanide, on the other hand, the scrap iron combined with the sulphur likewise contained in crude potash, forming sulphide of iron, and when potassium cyanide combines with iron sulphide, potassium ferrocyanide is produced. The chemical transformation taking place during this manufacturing process may therefore be represented by the following equations:

Large quantities of potassium ferrocyanide are at present made also from one of the by-products of the manufacture of coal gas. When coal is heated out of contact with air, part of its nitrogen is obtained in the form of ammonium cyanide. In the manufacture of illuminating gas the cyanogen thus produced is for the most part retained by the iron oxide used in purifying the gas, and when the iron oxide has become useless for the latter purpose, it is employed in making potassium ferrocyanide after another valuable product, ammonium sulphocyanate, has been extracted from it with warm water. The mass remaining behind is mixed with lime and heated with steam, the calcium ferrocyanide thus produced is first transformed into potassium-calcium ferrocyanide $\text{K}_2\text{CaFe}(\text{CN})_6$, by boiling with potassium chloride, finally, potassium ferrocyanide is obtained by heating the potassium-calcium salt with caustic potash.

Potassium ferrocyanide is extensively used for the manufacture of potassium cyanide and of Prussian blue as well as for a variety of other purposes.

Prussian blue, or Berlin blue, ferric ferrocyanide, $\text{Fe}_4[\text{Fe}(\text{CN})_6]_3$, is obtained by mixing potassium ferrocyanide with ferric salts in aqueous solution.

HYDROFLUORIC ACID (from *hydro-gen* + *fluor-ine*), HF. An acid compound of hydrogen and fluorine, analogous to hydrochloric, hydrobromic, and hydriodic acids, and first obtained by Scheele in 1771. It may be prepared by the action of sulphuric acid upon cryolite (q.v.) in an appropriate apparatus made of lead or of platinum. It may thus be readily obtained in liquid form, or rather in the form of an aqueous solution. The anhydrous acid may be obtained by heating acid potassium fluoride. As thus prepared, hydrofluoric acid is a colorless liquid, boiling at 19.5°C (67.1°F). Its vapors are exceedingly poisonous, and the liquid itself, even when mixed with more or less water, causes swellings on the skin that heal with extreme difficulty. Great care must therefore be taken in working with the acid. The density of the vapor is at ordinary temperatures abnormally high, showing the presence of a large proportion of double molecules H_2F_2 , in the vapor. As the temperature rises, these gradually break down, and at 88°C (190.4°F) the density attains the normal value corresponding to the simple formula HF. Solutions of hydrofluoric acid are used in analytical chemistry for breaking up minerals that are insoluble in strong hydrochloric and sulphuric acid. Another way of breaking up such minerals consists in fusing them with the carbonates of sodium and potassium, but then, of course, the amounts of these metals in the mineral cannot be determined, and hence it is usually necessary to treat a separate portion of the mineral with hydrofluoric acid. Hydrofluoric acid dissolves glass, forming hydrofluosilicic acid (H_2SiF_6) with its silica, hence its use for making etchings on glass, the acid being for this purpose often replaced by its ammonium and certain other salts (See **ETCHING**). The acid is now often kept in bottles made of a waxlike substance called "ceresin".

Among the salts of hydrofluoric acid, or fluorides (see **FLUORINE**), may be mentioned

those of the alkalis, which form an interesting series of double salts with the fluorides of other metals. The double fluoride of potassium and hydrogen (acid potassium fluoride) has been already mentioned as a source of pure hydrofluoric acid.

HYDROFLUOSILICIC ACID. See HYDROFLUORIC ACID.

HYDROGEN (from Gk *ὑδωρ*, *hydōr*, water, + *-γενής*, *-genēs*, producing, from *γίγνεσθαι*, *gignesthai*, to become). A gaseous element, discovered in 1766 by Cavendish, who called it "inflammable air." Paracelsus had already obtained hydrogen by treating iron with dilute mineral acids. But the existence of gases essentially different from air was not generally recognized until about the middle of the eighteenth century, and the properties of hydrogen gas were not definitely known before the researches of Cavendish. Lavoisier recognized its elementary nature and gave it its present name. In the free state hydrogen is found in the exhalations from volcanoes, in the gases issuing from the salt beds at Stassfurt and Wieliczka, in gases given off by oil wells, in the intestinal gases of animals, etc. The spectroscope reveals its existence in the atmosphere of the sun and of many stars, and it has been found "occluded" in meteorites and in various minerals. In combination it occurs as water, of which it forms nearly one-ninth by weight, and as a constituent of almost all organic matter. It may be obtained by the electrolysis of acidulated water, by the action of sodium, potassium, calcium, and certain other metals (e.g., superficially amalgamated aluminium) on water, by passing steam over red-hot iron wire, etc. One of the most convenient methods consists in allowing dilute hydrochloric acid, or preferably dilute sulphuric acid, to act on metallic zinc. Owing, however, to the impurities ordinarily present in zinc as well as in mineral acids, the hydrogen thus obtained is impure and has a disagreeable odor. Another convenient and economic method consists in electrolyzing a weak solution of sulphuric acid between lead electrodes, or a solution of caustic soda between electrodes of iron. Still another excellent method consists in decomposing the hydride of calcium with water. Various methods have also been employed for purifying the hydrogen first obtained. In 1909 Kammerlingh Onnes succeeded in obtaining a quantity of exquisitely pure hydrogen by freezing out the impurities with the aid of liquid air, the hydrogen itself, of course, refusing to condense. A large percentage of hydrogen is contained in ordinary coal gas, in which it is formed as a product of the destructive distillation of coal (organic matter). Much hydrogen is also contained in ordinary water gas, in which it is formed by the action of red-hot coal on water vapor.

Hydrogen (symbol H, atomic weight, either 1, the standard of atomic weights, or 1.008 when the figure 16 for oxygen is adopted as the standard, see ATOMIC WEIGHTS) is a colorless, tasteless, and odorless gas, whose critical temperature is -242°C , the critical pressure being 15 atmospheres (about 225 pounds to the square inch). It was first solidified in 1899 by causing it rapidly to evaporate when in the liquid state. In the gaseous state it is the lightest substance known, being $14\frac{1}{2}$ times lighter than atmospheric air and about 256,000 times lighter than the mineral platinum.

One liter, at 0°C and under normal atmospheric pressure (760 millimeters of mercury), weighs 0.089873 gram. In accordance with the atomic and molecular theory, the molecule of ordinary gaseous hydrogen is assumed to consist of two atoms and is therefore usually represented by the formula H_2 . The gas burns in the air with a nonluminous flame of very high temperature, combining with the oxygen to form water. When pure, though it cannot support animal life, hydrogen is not poisonous, and, when mixed with a sufficient quantity of oxygen or atmospheric air, may be inhaled for some time without inconvenience, but it weakens the voice and renders it high-pitched. Hydrogen gas is capable of being absorbed by certain metals, such as iron, platinum, and especially palladium. Graham, who studied this phenomenon, maintained that when thus "occluded" hydrogen assumed a true metallic form, and named that form of the element *hydrogenium*. Troost and Hautefeuille, too, believed that hydrogen is capable of forming alloys with metals, and some of the alloys obtained by them were found to have the composition of true chemical compounds, e.g., the hydride of sodium, NaH , the hydride of potassium, KH , the hydride of calcium, CaH_2 , etc. Hydrogen is also taken up in large quantities by colloidal solutions of platinum and palladium. (See COLLOIDS.) At ordinary temperatures hydrogen is chemically inert towards most of the other elements; with chlorine, however, it combines gradually in diffused, and with explosive violence in direct, sunlight. Its mixture with double its volume of oxygen explodes violently if ignited, the explosion is somewhat less violent if instead of two volumes of oxygen, about two and a half volumes of air are mixed with one volume of hydrogen. However, Baker showed, in 1902, that, if the mixture of hydrogen and oxygen is perfectly dry, the two gases refuse to combine, no matter how high the temperature to which they are exposed—a remarkable fact, indicating that the mechanism of the reaction is by no means so simple as may be inferred from its chemical equation as usually written. At elevated temperatures, or when in the nascent state (i.e., while being formed, say, by the action of dilute acid on zinc), hydrogen is a powerful reducing agent, i.e., it readily abstracts oxygen from compounds or adds itself to them. Nascent hydrogen is thus often employed in the preparation of organic compounds from given materials. With oxygen hydrogen forms two different compounds—water, H_2O , and hydrogen peroxide, H_2O_2 . With sulphur it combines directly, at the boiling temperature of the latter, forming sulphuretted hydrogen, H_2S . The ordinary compound of hydrogen with nitrogen is ammonia, NH_3 , another compound of hydrogen and nitrogen, termed hydrazine, has the formula N_2H_4 . Hydrochloric acid, HCl , is the compound of hydrogen with chlorine, the two elements combining, as stated above, under the influence of sunlight at ordinary temperatures. At somewhat elevated temperatures hydrogen similarly combines with the vapors of bromine and iodine, forming respectively hydrobromic acid, HBr , and hydriodic acid, HI . For the compounds of hydrogen with phosphorus, see PHOSPHORUS. For its compounds with carbon, see HYDROCARBONS.

Among the ordinary uses of hydrogen may be mentioned its use for the production of high temperatures, as in the oxyhydrogen flame. In

illuminating gas hydrogen acts as a diluent for the light-giving constituents, and its combustion yields much of the heat upon which the luminosity of the flame depends. On account of its great lightness hydrogen is used to give buoyancy to balloons.

HYDROGEN, SULPHURETED. See SULPHURETED HYDROGEN.

HYDROGEN DIOXIDE, PEROXIDE OF HYDROGEN, or OXYGENATED WATER, H_2O_2 . A colorless compound of hydrogen and oxygen containing, for the same amount of hydrogen, twice as much oxygen as is contained in water. It was discovered in 1818 by the French chemist Thénard. Minute quantities of it occur in the air, in rain water and in snow, and, according to some, in the juices of certain plants. In 1908 Keiser and McMaster demonstrated its presence in the water produced by burning hydrogen in oxygen, and, similarly, minute quantities of it are produced in the combustion of various organic substances, like alcohol, ether, etc. It may be prepared by the action of cold diluted hydrochloric, sulphuric, or nitric acid on hydrated barium peroxide. It can also be prepared by the action of hydrofluoric, hydrofluosilicic, or phosphoric acid on barium peroxide, or by slowly adding barium peroxide to distilled water through which is passed a rapid stream of pure carbon dioxide, and it has been prepared on a somewhat large scale by the action of acids on the peroxide of sodium. By any of these methods the peroxide is obtained in the form of a dilute aqueous solution. This may be concentrated by allowing the water to freeze out, or by passing a current of dry air through the solution kept at ordinary temperatures, or by allowing it to evaporate in a vacuum over sulphuric acid. The anhydrous peroxide thus obtained is a colorless, odorless, oily liquid with a harsh, bitter, metallic taste. It remains unfrozen at $-20^{\circ} C$, but crystallizes at the temperature of a mixture of solid carbon dioxide and ether. The crystals melt at $-2^{\circ} C$. When heated to the boiling point of water, it decomposes with violence into oxygen and water. When brought in contact with the skin, it causes a white blister, which after a time produces an irritating, itching sensation. It is a powerful bleaching agent and is largely used to remove color; it is particularly valuable for bleaching ostrich feathers, bones, ivory, silver, wood, silk, cotton, etc. Dilute solutions of it under special trade names are employed to produce a light color in hair. It has also been used to restore paintings that have become darkened by age. The peroxide is very useful in medicine and surgery as an antiseptic, rapidly destroying pus and similar discharges, in consequence of which it has been employed in diphtheria. Hydrogen dioxide has the power of freeing water from microorganisms, which has led to its use in brewing. It also destroys the acid and mold ferments in the wort. If taken internally, it has the effect of improving digestion and has therefore been used in certain forms of dyspepsia. Ordinarily the peroxide acts as a strong oxidizing agent, owing to the ease with which it parts with half of its oxygen. In certain cases, however, the same property has the effect of causing reduction. This happens, viz., whenever the peroxide is brought into contact with substances like oxide of mercury and especially potassium permanganate, which readily undergo decomposition. The reduction of such substances

is accompanied by the evolution of much heat, great volumes of oxygen being given off by the peroxide itself as well as by the substances undergoing reduction. The peroxide itself is readily decomposed into water and free oxygen by mere contact with certain substances, e.g., gold, platinum, and especially silver, without the metals undergoing any change, the action is particularly violent if the metals are in colloidal suspension. Among the substances that have this effect on the peroxide are most alkalies, and hence the peroxide can only be preserved in slightly acid solution, although, as Allain showed in 1906, common salt is a better and more desirable preservative of hydrogen peroxide than acids. According to Bredig, the decomposition of hydrogen peroxide by colloidal platinum is prevented by the presence of a little iodine. Before using such a solution a few drops of ammonia may be employed to neutralize the acid.

HYDROGEN SULPHIDE. See SULPHURETED HYDROGEN.

HYDROGRAPHIC OFFICE. A government institution for the preparation, publication, and distribution of charts and nautical information. In nearly all countries it is a bureau, or branch of a bureau, in the department of the navy or marine. The principal hydrographic offices of the world are the British, French, United States, Russian, German, Italian, Japanese, Netherlands, and Spanish, but several other nations have such establishments. The United States office is third in the number of different charts published. It was formally established by Act of Congress approved June 21, 1866, but had been in the course of development under the name of the Depot of Charts and Instruments since 1830. In 1842 the present bureau system of the navy was established, and the Depot of Charts and Instruments was attached to the Bureau of Ordnance and Hydrography as the hydrographic branch of that bureau, and embraced the United States Naval Observatory and the Hydrographic Office. From 1844 to 1861 Lieutenant (afterward Commander) M. F. Maury was in charge of the depot, and during this time he greatly developed—almost created—the science of marine meteorology and oceanography.

Previous to 1866 only a comparatively small number of charts of ordinary navigational type were published; but Maury compiled a vast amount of data derived from the log books and reports of men-of-war and merchant vessels, and, after drawing from the data the proper conclusions, he published the results in the form of "Wind and Current Charts," which included track charts, trade-wind charts, whale-feeding-ground charts, storm and rain charts, and thermal charts.

The present Hydrographic Office is a branch of the Bureau of Navigation of the Navy Department. It is composed of the divisions of Chart and Book Supply, Chart Construction, Sailing Directions, and Pilot Chart and branch offices. The head of the office, who has the title of hydrographer, is a naval officer, usually a commander or captain, and he has another naval officer as his assistant.

The office publishes charts of the oceans and of foreign coasts and harbors, also charts of the Great Lakes and general sailing charts of the United States coast and insular possessions. The detail charts of United States territory are

published by the Coast and Geodetic Survey (qv). Pilot charts are published covering the north Atlantic, south Atlantic, north Pacific, south Pacific, and Indian oceans. These charts show the probable direction and force of winds, position of derelicts or other dangers to navigation, storm tracks, areas of fog or icebergs, best tracks for vessels to follow, ocean currents, and a great mass of other matter useful to mariners. About 150,000 of these charts are printed annually, nearly half the number being of the north Atlantic. The north Atlantic, north Pacific, and Indian Ocean pilot charts are published monthly, the others, quarterly. A pilot chart of the Great Lakes is issued at intervals. The information given by the pilot charts is supplemented by a weekly publication called the *Hydrographic Bulletin*, of which 250,000 are issued annually.

The office publishes weekly a pamphlet of several pages, called *Notices to Mariners*, which gives a definite account of all newly discovered rocks, shoals, and other dangers to navigation, also changes in the character or position of lighthouses, buoys, and other navigational aids. It publishes from time to time revised lists of lighthouses, buoys, etc., throughout the world, and volumes, entitled *Sailing Directions*, which contain full information in regard to ocean currents, the weather, and the character of the seacoasts in the different parts of the world, descriptions of harbors, of aids to navigation, and of other matters of interest to navigators and mariners generally. The office also publishes *Bouditch's Practical Navigator* (qv), *Azimuth Tables*, *Projection Tables*, and similar works. There are printed annually 10,000 to 15 000 copies of books.

On July 1, 1914, the number of different engraved charts was about 1300 and of lithographed charts about 700.

For the purpose of gathering and disseminating information of interest to mariners and to assist them as much as possible, branch hydrographic offices have been established in the ports of Boston, New York, Philadelphia, Baltimore, Norfolk, Savannah, New Orleans, Galveston, San Francisco, Portland, Port Townsend, Duluth, Sault Sainte Marie, Chicago, Cleveland, and Buffalo. Others will probably be established at Colon, Honolulu, and Manila if Congress grants sufficient money for the purpose.

Three to five small vessels of the navy are engaged, under the direction of the Hydrographic Office, in surveying in various parts of the world, chiefly in the West Indies and on the coasts of Central and South America. Additional surveys are frequently made by naval vessels in regular service. A number of small vessels of the British navy are engaged in hydrographic surveying in parts of the world under British jurisdiction or belonging to countries that make no surveys. Similar work, on a smaller scale, is done by several other governments. Each national hydrographic office reproduces the charts of the others as far as its requirements are supposed to make necessary.

For further information, consult Hughes, *Founding and Development of the Hydrographic Office* (Washington, 1887), *The Origin and Mission of the Hydrographic Office* (Hydrographic Office Pamphlet, 1910), *Annual Reports of the Hydrographer to the Bureau of Navigation* (Washington). See HYDROGRAPHY, CHART, MAP, and section on NAVY under UNITED STATES.

HYDROGRAPHY (from Gk ὑδωρ, *hydōr*, water + -γραφία, *-graphia*, writing, from γράφειν, *graphein*, to write). That branch of the science of physical geography which treats of the surface waters of the earth particularly with reference to their bearing on navigation. Practically every civilized nation, and particularly all maritime nations, have special governmental departments whose duty it is to survey and chart the navigable waters belonging to the nation and also the waters of the oceans wherever navigation extends.

The first step in the modern science of hydrography was made in the fifteenth century by Prince Henry, "the Navigator," who was the first to make a sea chart worthy of the name. But little was done in the way of hydrographic work until Capt James Cook of the British navy began his famous career of exploration and surveying in 1759. His first work was the survey and mapping of the St Lawrence River from Quebec to the ocean. In 1763 he was appointed "marine surveyor of the coast of Newfoundland and Labrador," and he held this office until 1767. During this time he both made charts and wrote volumes of sailing directions and also began to make a name for himself as a mathematician and astronomer. Until his death, in 1779, he continued to explore and survey in the Indian Ocean and the Pacific. While Cook was collecting data and charting them, Alexander Dalrymple wrote an essay on marine surveying, which was published in 1771. Upon the founding of the British Hydrographic Office, in 1795, Dalrymple became its first chief. Cook was followed by La Pérouse, who was sent out by the French government in 1785. After some years of work La Pérouse was wrecked near Australia, and all hands are believed to have been lost. In 1791 another French exploring expedition was sent out under the command of D'Entrecasteaux and did much work in the great Eastern Archipelago. Beautemps-Beaupré, the navigating officer of this expedition, wrote a work on marine surveying which was published in an appendix to the narrative of the voyage (1808). Beautemps-Beaupré was afterward placed in charge of the survey of the French coast.

The British Hydrographic Office was established in 1795. Up to this time very few charts were duplicated, and still fewer were based on regular surveys. Charts of the oceans and coasts were very indefinite as to depths and exact positions of coast lines. When near the coast, most vessels depended upon the lead or upon local pilots. The French Bureau of Hydrographic Surveys, which was organized in 1781, led the way in chart production, but its work was greatly checked by the financial condition of the country and nearly destroyed by the French Revolution.

The British Hydrographic Office was established at a fortunate time, as its development was continuous. It is to-day the greatest of the national hydrographic offices and publishes charts of every part of the world. The French office is second, and that of the United States (see HYDROGRAPHIC OFFICE) third. In addition to the Naval Hydrographic Office, the United States has a Coast and Geodetic Survey, which prepares and publishes charts of the coast both of the United States and its insular and territorial possessions.

The first records we have of charts in which

there was an attempt to locate places by latitude and longitude appear in the maps of Claudius Ptolemy, of Alexandria, in the second century A.D. The charts of Columbus were not much more definite. It was therefore the province of the newly established hydrographic offices to collect and prepare all existing data and publish them. Up to this time the few existing charts had been put out by private publishers.

During the latter part of the eighteenth century and early part of the nineteenth much was gained. By the middle of the nineteenth century the many exploring expeditions had covered the navigable world, and their work had been charted. The next step was a greater accuracy in the determination of geographic positions and a more careful survey of coasts, especially of the coast of countries which did not make their own surveys. The work is yet far from completed, but practicable charts have been issued of nearly all coasts and harbors in the world. The constant changes due to the erosion of the sea and deposit of the rivers and tides necessitate frequent resurvey in many places to make the charts safe to navigate by. Parts of the United States coast and many of its harbors have to be resurveyed every 10 years. Some harbors with shifting sand bars at the entrance have to be examined and the buoys shifted two or three times a year.

The method of conducting the hydrographic survey of a harbor, bay, inlet, or other small body of water, is as follows. Two points, whose exact location has been determined by some general survey of that portion of the country, are selected to form the base. (See GEODESY.) If the exact locations of two points and the distance between are known, this distance is assumed as the base. If the distance is not known, it is measured by base apparatus (copper bars incased in wood and supported on trestles) or by a steel or invar tape, the tape being kept carefully taut and at a constant and determined tension, level, and in a straight line between the points. The base having been established, various other points about the harbor are located by triangulation. If the existing objects are not well spaced about the harbor, additional tripod or pole structures must be erected. For ordinary work sextant angles suffice, but for larger or more exact triangulation theodolites are used and great care taken with the observations and computations. The first triangles are formed with the base as one of the sides and the point to be located as the vertex of the opposite angle. All three angles are measured, and the sum should not be less than 180° nor more than $180^\circ 1'$, unless the distances are short and the survey a small one. Angles of less than 30° are to be avoided unless observed with great care and exactitude. After several points have been located from the base line other triangles are formed, using these points for vertices, and so on until the requisite number of stations—or "signals," as they are called—is reached.

The next step is to prepare a plan of the harbor (or area to be surveyed) on a suitable scale for the work—1 to 2500 (i.e., 1 foot on the chart represents 2500 feet) is a common one, but in important harbors and channels 1 to 500 is sometimes necessary. The base line is laid down upon the chart, and then the other points which have been determined by the triangulation survey. The shore line and topo-

graphical features are next obtained by a topographic survey with a plane table or other instrument. For determining the shore line only, a fairly accurate method consists in running from point to point along the shore, measuring changes of direction by a theodolite and

TRIANGULATION FOR SURVEY OF A HARBOR
A B, base Triangles, ABC, ABD, ABE, ABF, BCG, BCH

distances with a surveyor's chain or steel tape. At such frequent intervals as may be necessary the distance to the water's edge is measured at right angles to the direction in which the lines are run from point to point.

Having determined the shore line, the plan for sounding is prepared. The lines on which the soundings are desired (and on which the boat is to run) are then placed on the plan (or boat sheet, as it is called). There are usually two sets of these lines, one set intersecting the other at right angles, but this arrangement is

PLAN OF HARBOR (BOAT SHEET)
Showing lines on which soundings are to be taken

frequently varied. Sometimes the lines intersect at 60° or 45° , and sometimes three sets are requisite. The lines of each set are from 100 to 1000 feet apart, depending upon the character of the survey.

Small steam launches are commonly used in hydrographic work. The leadsman stands in

a convenient framework near the bow. Two observers, each with a sextant, are aft, also a recorder with a watch and a notebook to record angles and soundings. The boat proceeds at constant speed and is kept on as straight a course as possible by means of a range of any two objects on shore or by frequent determinations of its position. Every 10, 20, or 30 seconds (depending upon the depth and speed) a sounding is taken, the recorder giving the signal to sound. At intervals of one minute or more (usually two to four minutes) the position of the boat is determined by sextant angles. The observers use any three of the "signals" located by the triangulation. One measures the angle from the right object to the centre one, the other measures the angle from the centre to the left. These two angles determine the position very exactly, and it is quickly plotted on the sheet by means of an instrument called a three-arm plotter. If this position shows the boat is drifting away from the desired line, the necessary change in course is made.

While this is going on, the heights of the surface of the water on a near-by tide gauge must be observed or taken by a recording instrument. If the plane of mean low water is not known, it must be determined from gauge observations (preferably for at least two months) of low waters. The average height of all the low waters for the observation interval is taken as mean low water. All soundings taken are reduced to this plane before being placed on the finished chart. They are spaced in by time between the positions determined by sextant angles.

Offshore soundings are usually made from a surveying ship of 100 tons or more. The ship determines her position by angles as long as she can see the shore and then spaces her soundings by time. Deep-sea soundings are taken by large vessels especially fitted with a deep-sea sounding machine. This consists of a wire, a shot or sinker, a tube for obtaining temperatures and character of the bottom, and a machine which controls a reel for letting out or hauling in the wire. The shot or sinker is usually released and left behind when it strikes the bottom. This relieves the strain on the wire in reeling in, and this relief is necessary in very deep sounding.

In addition to determining the depths and tidal rise and fall in a harbor it is desirable also to ascertain the speed and direction of the current. This may be done by means of the old-fashioned chip log, the observations being taken at suitable intervals. An easier and more satisfactory method to ascertain the speed is to employ a recording current meter. Direction meters for determining the direction of the current at any depth below the surface have been devised and are used to some extent. To determine the volume of water passing at any time, the current observations must be made at several depths and at points located at intervals all the way across the stream. Such observations show that the current on the surface of a tidal harbor is frequently in the opposite direction to that near the bottom, the conditions depending upon the state of the tide.

The finished chart (qv) is supposed to embody all the available data of use to navigators. After the soundings are entered on the plotting sheet, curves of equal depth are drawn, and only characteristic soundings placed on the final

chart. Charts are engraved or etched on copper or lithographed. Lithographic work is cheaper, but less satisfactory.

The greater part of hydrographic surveying is done in the vicinity of coasts, shoals, and islands, since it is there where lie the dangers to navigation. Deep-sea sounding is of scientific interest only, the principal commercial use being the determination of suitable routes for submarine cables. See DEEP-SEA EXPLORATION, DREDGE, HYDROGRAPHIC OFFICE, COAST AND GEODETIC SURVEY, CHART, MAP.

HYDROID (from Gk. ὑδροειδής, *hydroeidēs*, like water, from ὕδωρ, *hydōr*, water + εἶδος, *eidos*, form). One of a class of coelenterate animals, notable for their delicacy and beauty and receiving their name from their structural resemblance to *Hydra* (qv). The name is now generally restricted to the polyp forms of the *Hydromedusæ*. (See HYDROZOA.) They exist in compound colonies—one kind having the office of feeding the community, another of protecting it, and another of reproduction. The feeding hydroids are usually fixed, or attached to some object, and proceed from eggs of the reproductive hydroids, or medusæ, the latter in turn growing from buds produced by the former. The medusæ sometimes remain attached to the stem or become free-swimming. The body of the nutritive hydroid is usually supported by a stem of variable length, but may rest immediately upon the bottom. From one individual buds appear and produce branching colonies of hundreds or thousands, often having a height of 15 or 20 inches, and the giant hydroid of Japan is more than 3 feet high. The reproductive hydroids are sometimes developed into perfect medusæ before leaving the parent stem, but they usually break away before attaining their perfect state. Some buds never become much developed and are called gonophores. These usually remain attached, but attain sexuality and reproductive power. Most hydroids are covered with a chitinous envelope, which is continuous over the branching stem of the entire colony, but some species are naked and soft. In tubularian hydroids the chitinous envelope, when present, simply incloses the stem and branches, but is not expanded around the individual polyps (*hydranths*) in the form of a cup. In campanularian hydroids, however, each hydranth is surrounded by a cup, a continuation of the chitinous envelope, into which it can withdraw itself. Hydroids abound in the ocean in various parts of the world, notably the northwest coast of America, the Caribbean Sea, and around Australia. Their colors are usually not brilliant, brown, flesh color, and white being the most common. A familiar and beautiful example is the Portuguese man-of-war (qv). Consult Alexander Agassiz, *North American Acalephæ* (Museum of Comparative Zoology, Cambridge, 1875). See SIPHONOPHORA, ALTERATION OF GENERATIONS, and the accompanying illustration.

HYDROMANCY. See DIVINATION.

HYDROMETER (Gk. ὑδρομέτριον, *hydrometron*, vessel for hydrostatic measurement, from ὕδωρ, *hydōr*, water + μέτρον, *metron*, measure), also known as **AREOMETER**. An instrument used in determining the specific gravity of liquids and in some instances of solid bodies.

Specific gravity, for determining which the hydrometer is used, is the ratio between the weight of a given quantity of a substance and

that of an equal volume of water at its temperature of maximum density, 4°C , so it follows that the specific gravity of two substances must be directly proportional to their weights when the volumes are the same, or inversely as their volumes when the weights are equal. The hydrometer, which usually is a hollow instrument of glass or metal designed to float upright in a liquid, makes use of the principle of Archimedes that the weight of the volume of liquid displaced by a body is equal to the weight of the body itself. In its simplest form a hydrometer might consist of a graduated scale floating vertically in a liquid, and on which the level of the surface of the liquid it displaces could be measured. For example, an ordinary ruler if allowed to float upright in water would sink until a certain division on the scale is reached. This reading multiplied by the area of the cross section of the ruler will give the volume of a mass of water equal to that displaced by the ruler and equivalent to the weight of the ruler itself. Immersing the ruler in a liquid of different specific gravity, it will sink until the surface touches some other division on the scale, and, as before, the volume of a mass equivalent to the weight of the ruler will be obtained. A ratio made with these two quantities representing the volumes of the two liquids would give the specific gravity, but, as the cross section of the ruler is a constant quantity, it is only necessary to compare the two readings on the scale.

The ordinary hydrometer consists of a smooth, transparent glass circular tube of uniform cross section and thoroughly annealed, usually terminating in one or more bulbs, the lower of which may be filled with mercury or shot in order to keep the instrument steady with its axis in a vertical position when immersed in a liquid. Such a hydrometer is extensively used in scientific and commercial work, as it can be graduated to furnish direct readings of the specific gravity of a liquid. The mark to which the instrument would sink when placed in water is usually marked 1.000, and the weight of water displaced is equal to the total weight of the hydrometer. If the instrument be placed in a liquid that has a less specific gravity than water—alcohol, e.g.—it will sink until the surface of the liquid touches some point higher up on the stem, as in this case it takes a greater volume of the lighter liquid to be equivalent to the weight of the hydrometer. The scale on which the readings are made is on a piece of paper contained inside of the stem, and the method of graduation forms the chief distinction between the different instruments. In the instrument of Gay-Lussac, which is known as a volumeter, the water point was marked 100, and the division was carried along the stem both above and below this mark on the basis that the amount of the stem between any two scale divisions should equal $\frac{1}{100}$ of the volume of the part immersed in water. With an instrument graduated in this manner the specific gravity is obtained by dividing the reading into 100. In practice it is more convenient to use a hydrometer whose scale is graduated to read specific gravity direct, but in this event the scale is irregular, and great care must be exercised in the construction and testing of the instrument, for all accurate work a certificate from some competent authority or institution, such as the United States Bureau of Standards

that the instrument has been tested and approved, being essential. The accuracy of a hydrometer is greatly increased by making its stem as slender as possible and consequently increasing the space between the divisions, so it is customary to construct a number of instruments, each having a limited range and designed for liquids of different densities. The hydrometer, when used for a special purpose or substance, frequently undergoes modifications. The alcoholmeter, e.g., is so graduated as to give at once the strength of mixtures of ethyl alcohol and water according to either per cent by weight or per cent by volume. The urinometer, lactometer, saccharometer, and other instruments are all hydrometers used for special purposes, as is also the hydrometer for determining the strength of sulphuric acid or the strength of the acid solution of a storage battery. Elaborate tables have been worked out for use in connection with various forms of special hydrometers, and some of these will be found in *Circular No. 19, United States Bureau of Standards* (Washington, 1913). Hydrometers with arbitrary scales also play an important part in scientific work, though the present tendency is towards the exclusive use of specific-gravity values. In the Baumé scale, which is encountered frequently in chemical processes, a second fixed point on the hydrometer stem is determined in addition to that given by water. This is obtained by dissolving one part by weight of common salt in nine parts of water, and then the space between these two points is divided into 10 equal parts, which are called degrees. The water point is marked 10 on the scale, and the division is carried beyond for 40° . For liquids heavier than water the second fixed point is determined by immersion in a solution of 15 parts of salt in 85 parts of water, and the space between it and the water point, which is marked 0, is divided into 15 equal divisions. Exact tables for comparison with specific gravity will be found in *Circular No. 19*, cited above. The scales of Cairier and Beck are occasionally found, though less frequently than that of Baumé.

The accompanying tables afford a comparison of the Baumé degrees (American standard) scale with the true values of specific gravity.

LIQUIDS LIGHTER THAN WATER

SPECIFIC GRAVITY	Baumé
.75	56.7°
.80	46.3
.85	34.7
.90	26.1
.95	17.7
1.00	10.0

LIQUIDS HEAVIER THAN WATER

SPECIFIC GRAVITY	Baumé
1.1	0°
1.1	13.2
1.2	24.3
1.3	33.7
1.4	41.8
1.5	48.8
1.6	54.9
1.7	60.0
1.8	65.0
1.9	69.0
2.0	73.0

The specific gravity of liquids changes with the temperature, so that it is of the utmost importance to have the liquid at uniform and at standard temperature. It is necessary to use a thermometer and, if necessary, apply suitable

corrections to reduce the specific gravity of the liquid to the standard temperature. For this purpose many of the finer hydrometers contain within their stems a thermometer tube whose bulb is placed in the lower portion of the instrument, and the instrument is known as a thermohydrometer.

In the United States Internal Revenue Service the hydrometers furnished to the inspectors are so graduated as to indicate the number of parts by volume of proof spirit equivalent to the volume of the liquor at the standard temperature, which is 60° F. They are constructed so as to read 100 for proof spirit and 200 for absolute alcohol. Proof spirit in the United States is defined by law to be that mixture of alcohol and water which contains one-half of its volume of alcohol, the alcohol when at a temperature

of 60° F. being of specific gravity 0.7939 referred to water at its maximum density. Proof spirit has at 60° F. a specific gravity of 0.93353, 100 parts by volume of the same consisting of 50 parts of absolute alcohol, and 53.71 parts of water.

A hydrometer of a different type from those described above is the weight hydrometer, where the submerged volume remains constant; but, as the specific gravity of the liquids changes, the weight of the instrument must be varied in order to immerse it to a given point. The Nicholson hydrometer is representative of this class and consists of a brass tube with conical ends, which floats upright and carries above a thin stem the carrying pan in which may be placed a substance whose specific gravity is to be found. When used to determine the specific

SET OF UNITED STATES STANDARD HYDROMETERS AS USED BY THE INTERNAL REVENUE OFFICE.

gravity of a liquid, the weight of the apparatus is first ascertained, and then it is placed in water and weights added until a marked point on the stem is at the surface of the water. If the instrument is placed in a liquid of greater specific gravity, then additional weights must be placed on the pan in order to sink the stem to the mark, while, if the liquid is less dense, the number of the weights must be diminished. The weight of the instrument increased by the amount of the weights added when the instrument was placed in water, divided by the weight of the instrument and the weights added when the instrument was in the liquid under test, will give the specific gravity. This hydrometer can also be used to determine the specific gravity of a solid, in which case the latter is first placed in the upper pan, while the instrument is in water, and the number of weights which must be removed is noted. The substance is then placed in the lower pan, and the amount of weight which must be removed to restore it to its former position ascertained. The difference in the two amounts represents the weight of the

water displaced by the substance, and, if divided into the sum of the weights removed when the body was placed in the upper pan, will give the specific gravity. The hydrometer of Fahrenheit is based on a similar principle, but is made of glass instead of metal and has a bulb filled with mercury at its lower end instead of a weighted cup. It can only be used for liquids. These instruments are not so reliable as the ordinary hydrometers and are not so widely used. In the most accurate determinations of specific gravity a chemical balance is employed, and equal volumes of the liquid actually weighed, or, if the substance is a solid, it is weighed both in the air and in distilled water, suitable corrections being applied for temperature and other disturbing influences.

Historical. The hydrometer is without doubt one of the earliest pieces of physical apparatus, its invention being generally ascribed to Archimedes, to whom is due the principle on which it is based. The instrument is mentioned by Priscian, who died about 500 A.D., and it is also described by Synesius of Ptolemais in a letter to Hypatia of Alexandria, under the name of hydroscepium, as follows: "It is a cylindrical tube the size of a reed or pipe, a line drawn along it lengthwise which is intersected by others, and these point out the weight of water. At the end of the tube is a cone the base of which is joined to that of the tube so that both have but one base. This part of the instrument is called *baryllion*. If it be placed in water, it remains in perpendicular direction so that one can readily discover the weight of the fluid." The date of this letter can be approximately fixed by the fact that Hypatia was murdered in 415 A.D. The use of the hydrometer was known to the Saracens of the tenth and eleventh centuries, and one of their writers, Al-Khazint, attributes its invention to a Greek philosopher named Poppius, a contemporary of Theodosius the Great. In this connection this same writer refers to the fundamental discovery of Archimedes. Consult any of the larger manuals of physics, but, for special information on the hydrometer, *The Testing of Hydrometers* (Circular No. 16, United States Bureau of Standards, 3d ed., Washington, 1914); also *Standard Density and Volumetric Tables* (Circular No. 19, 3d ed., ib., 1913). The United States Treasury Department publishes, for the use of the internal revenue service, manuals for using the hydrometer in alcoholometry. See Illustration in article SPECIFIC GRAVITY.

HYDRONITRITES. See HYDRONITROUS ACID.

HYDRONITROUS ACID, HN_3 . An acid gaseous compound of hydrogen and nitrogen, first obtained by Curtius in 1890. An easy method of preparing this acid was subsequently worked out by Angeli and consists in adding hydrazine hydrate (see HYDRAZINE) to a concentrated solution of silver nitrate, the result being a precipitate of silver hydronitrite, AgN_3 , from which free hydronitrous acid may be obtained by decomposing with sulphuric acid. The salts of hydronitrous acid, or *hydronitrites*,

NICHOLSON HYDROMETER

are violently explosive compounds, and then preparation should not be undertaken by inexperienced persons.

HYDROPATHY (from Gk *ὕδωρ*, *hydōr*, water + *πάθος*, *pathos*, feeling) Water cure or water treatment. A system of treatment of diseases with water to the exclusion of other agencies. A word of incorrect composition, formerly applied to a method now obsolete. See **HYDROTHERAPY**.

HYDROPHANE (from Gk *ὕδωρ*, *hydōr*, water + *φανός*, *phanos*, clear, from *φαίνω*, *phainō*, to appear) A translucent variety of opal (qv) that is either whitish or light-colored, and becomes more transparent or translucent in water.

HYDROPHILÆ See SEA SNAKE.

HYDROPHILIDÆ (Neo-Lat nom pl, from Gk *ὕδωρ*, *hydōr*, water + *φίλος* *philos*, loving) A family of scavenger beetles, most of which swim in the water or crawl on the submerged parts of plants in quiet pools. They are elliptical black beetles with club-shaped antennæ. Because of the fact that they carry a film of air on the ventral surface of the body, this part has a silvery appearance. The larvæ are carnivorous, but the adult beetles live chiefly on decaying vegetation. There are 150 species of this family in the United States. One of the most common species is *Hydrophilus triangulatus*. A few forms live in moist earth or dung and subsist upon maggots which inhabit such places.

HYDROPHILOUS A term which has been applied particularly to plants which are pollinated through the agency of water. It has also been applied by some authors to hydrophytic plants, but should be entirely discarded there both because of its previous use in another sense and because it is an undesirable word in all senses. The term "water-pollinated" is preferable in the first sense. See **POLLINATION**.

HYDROPHOBIA (Lat, from Gk *ὕδροφοβία*, *hydrophobia*, from *ὕδροφόβος*, *hydrophobos*, dreading water, from *ὕδωρ*, *hydōr*, water + *φόβος*, *phobos*, fear), or **RABIES**, also called **LYSSA**. An acute infectious disease of warm-blooded animals produced in man by the implantation of a specific virus through the bite of an animal sick with the disease. This disease has been known since the earliest historical times. Democritus of Abdera gave an account of it in the fifth century B C. Aristotle in the fourth century B C described it in animals, but denied its existence in man. Celsus (21 B C) detailed some of its symptoms and advised suction and the actual cautery in the treatment. Xenophon, Ovid, Vergil, Horace, Plutarch, all referred to rabies in their works. Boerhaave (qv) and Van Swieten (1771) described the disease intelligently and recognized the paralytic type in man. John Hunter (qv), Magendie (qv), Marochetti, Morgagni, Trousseau, and Dupuy all wrote of it. Youatt (1850), the celebrated veterinarian, considered rabies at length in his books and relied on early cauterization with nitrate of silver to obviate infection. Yet, after being bitten seven times with impunity, he is reported to have died of rabies at the last. Viichow and Von Ziemssen propagated the disease by the hypodermic injection of saliva of a rabid animal. After many others had added to our knowledge of hydrophobia Pasteur (qv), in 1882, began to treat the disease with scientific accuracy.

The geographic distribution of the disease is wide. It has been found in Greenland, where it was epidemic in 1860, in Constantinople, where it prevailed in 1839, in Egypt, in London, in Hamburg, in Saxony, in Bavaria, and in many parts of the United States, the prevalence of the disease in Washington, D C, in 1899-1900 raising grave apprehension. During 1914 there were several outbreaks of canine rabies in various States, but few persons were bitten. In Russia and Siberia very many instances of rabid wolves have been recorded. The disease is found most frequently in the dog, the wolf, the cat, and the cow. The skunk, also, seems to be peculiarly liable to hydrophobia, and the disease in this animal has been considered distinct and worthy its own name of *rabies mephitica*. A careful consideration of all the known facts, however, leads to the conclusion that the disease is one to which all the lower animals, and man also, are liable, that it is protean in its manifestations, chiefly because of the thousand and one concomitant circumstances and elements, and that the collected statistics are mostly so tainted, from manifold sources of error, that they need to be sifted with the utmost care. It is, however, safer to treat every skunk bite as though certainly by a rabid animal, since in most cases the facts cannot be known. (The curious will find the question most interestingly discussed in a candid manner in Coues's *Fur Bearing Animals*.) The nature of the infecting virus is as yet unknown. It is found in the saliva, particularly that of the parotid gland. In man there is a variable incubation from three weeks to six months, the period depending largely on the site of the infection. Wounds about the neck and face are especially unfavorable in prognosis, next are those of the hands. Punctured wounds, because of the difficulty of cauterizing them, are most dangerous. Three stages are described. In the *premonitory stage* there is pain, numbness, or irritation about the bite. Irritability, nervousness, and depression are common. In the *stage of excitement* there is great hyperæsthesia. Almost any slight stimulus will cause intense reflex excitability and convulsions. The muscles of deglutition are extremely rigid or even paralyzed, and any attempt at swallowing may cause spasms of the throat and general convulsions, these may even follow the thought of swallowing. The name "hydrophobia" is erroneous and based upon false inferences from these facts. The sufferer from rabies does not fear water—he intensely desires it, as he is devoured with thirst, but he cannot swallow it, nor even "go through the motions" of swallowing. There is also a secretion in the throat and mouth of a thick, viscid mucus, with thickened saliva, and the effort to get rid of this with muscles refusing to act, causes the bark-like cough and hawk so often described as "barking like a dog." The patient does not bark, and it is doubtful if he bites. The temperature rises, and the patient may become maniacal. This stage may last from one to four days, and then the *paralytic stage* supervenes. In this stage the spasms stop, unconsciousness supervenes for the first time, the action of the heart ceases, and the patient dies.

The gross pathological changes found after death from hydrophobia are not characteristic. The most constant are found in the nervous system, especially in the region of the medulla.

oblongata and pons. The changes consist in a varying degree of inflammation, marked by small round-cell infiltration of the blood-vessel walls, exudation into the pericellular lymph spaces, small hemorrhages, and sometimes thrombosis of the small blood vessels. More recently microscopical study has demonstrated extensive degenerative changes in the nerve cells. Lesions have also been noted in the sympathetic, consisting in degeneration of the nerve cells and increase in the thickness of their endothelial capsules. In 1903 Negri announced the discovery of certain bodies in the nerve cells of rabid animals. These, the so-called Negri bodies, are found very constantly and are described as consisting of a homogeneous, nongranular substance, resembling coagulated albumin. They are from 1 to 23 micromillimeters in diameter, oval, round, or triangular in shape, and within them are clear shining areas. The nature of these bodies is unknown. Negri believes them to be protozoa and considers them the causative agents of the disease. Williams, in 1906, was convinced that these cell inclusions were of animal nature and called them *Neurocytes hydrophobice*. All attempts to cultivate this alleged organism, however, were unsuccessful, and the late "complement fixation test" is likewise negative. In addition to the changes in the nervous system there is usually congestion of the mucous membrane of the gastrointestinal tract and of the pharynx, larynx, and bronchi. Despite the fact that innumerable attempts to discover the cause of the disease have been made without success, it still seems probable that hydrophobia is due to an ultramicroscopic microorganism. This organism is not apparently widely distributed throughout the body, but confined mainly to the saliva and the central nervous system. An emulsion made of the medulla of a rabid animal, injected into dogs, cats, rabbits, guinea pigs, etc., produces symptoms characteristic of the disease, although in rodents there is little or none of the stage of excitement.

Although we have no knowledge as to the specific germ of the disease, hydrophobia furnishes our most remarkable example of the success of artificial immunization by means of protective inoculation. To Pasteur (qv) is due the credit not only of the discovery of the preventive treatment of hydrophobia, but of demonstrating through it a principle in therapeutics which is of constantly widening application. Pasteur found that he could induce the disease in rabbits by inoculations with portions of the spinal cords of rabid animals, and that the spinal cords of these rabbits possessed a high degree of virulence. Drying in air reduced the virulence in direct proportion to the length of the drying. It was found that, while inoculation of man or animals from the fresh rabbit cords was invariably fatal, if the man or animal was first inoculated from one of the cords the virulence of which had been greatly reduced by the drying, and then from cords of gradually increasing virulence, he could become so accustomed to the virus that injection of the fresh cord would no longer be fatal, and such a series of inoculations made sufficiently soon after the bite of a rabid animal was found to prevent entirely the development of the hydrophobia. Advantage is taken of the long period usually elapsing between the bite and the onset of the disease to practice these preventive inoculations, and the result has been a marked

decrease in the mortality from the bites of rabid animals. In view of the uniformly fatal results of untreated hydrophobia and the success of the Pasteur treatment, the importance of determining at the earliest possible moment whether the animal by whom a person has been bitten had rabies can be readily appreciated. The animal should not be killed, for, as rabies is invariably fatal to canines, the recovery of a sick animal definitely disproves rabies. On the contrary, the animal should be carefully watched and, if it dies, should be sent to a laboratory where examination can be made and the question of rabies definitely settled by inoculation experiments on animals or microscopical examination of the brain and cord. The treatment should be cauterization in every case, less than one hour after the bite, by means of the actual cautery, strong acid, or acid nitrate of mercury. Wounds must be opened by the surgeon, and even amputation may be necessary. Washing and syringing wounds with water at 130° F is desirable. Sucking the wound to draw out the poison has been practiced and may be safely done if there are no breaks of the membrane of the lips or mouth. A method recommended by Kenle is as follows: The wound is washed with bichloride solution and dried, a strong solution of carbolic acid is then applied to the depths of the wound or wounds with a suitable applicator, this is followed immediately by pure nitric acid, and this again by alcohol. A surgical dressing is then applied. Under thorough cauterization rabies develops in 33 per cent of cases bitten, without cauterization, in 83 per cent. Administration of morphine or alcohol does harm. Immunizing by the Pasteur method should be practiced in all cases. By this method the patient is inoculated with attenuated virus by the injection hypodermically of emulsion made from the brain of a rabid animal repeated in stronger and stronger concentration during 21 days. The results of the Pasteur method are now indisputable, but it is of the utmost importance to begin the treatment as soon as possible after the injury, as the prospect of success grows less and less day by day of delay. Following are the results of the antirabic treatment at the Institut Pasteur, Paris, from 1886 to 1908 inclusive: 31,330 cases were treated with 238 deaths, a mortality rate of 0.759 per cent. During treatment 50 deaths occurred, or 0.159 per cent, within a short time after treatment. 188 died, or 0.601 per cent. Reinlinger found a mortality rate of 0.41 per cent in 131,579 cases. The treatment is not entirely harmless. Besides the local and constitutional reaction there sometimes occurs paralysis or paraplegias, which occasionally prove fatal. Pasteur institutes are distributed well over the civilized world, most large cities having one. In New York City the virus is now made and distributed by the department of health. The New York State Department of Health was the first to send out treatment packets by mail. The practice of State treatment and distribution, as well as the examination of dogs, is now well organized throughout the United States.

Pseudorabies, or Lyssophobia, is a hysterical condition, in which the patient, who imagines that he has rabies, in his morbid condition of mind enacts some of the symptoms and may even be frightened to death.

HYDROPHYTES (from Gk ὕδωρ, *hydōr*, water + φυτόν, *phyton*, plant) Plants which grow naturally either in water or in very wet soil. This term is contrasted with "mesophytes" and "xerophytes" (qv). Common illustrations of hydrophytic plant societies are swamps of all kinds, pond societies, and ocean plants. Various classes of hydrophytes are taken up under separate heads, where the main features of the various hydrophytic societies will be discussed. It will be desirable, however, to give a short account of the characteristic hydrophytic structures. The roots of hydrophytic plants are in most cases very greatly reduced and in some cases altogether lost, as in some of the duckweeds. Root hairs are also commonly lacking in water plants. The stems and leaves are not, as a whole, conspicuously reduced in water plants, but they show peculiarities of structure that are quite interesting. The leaves of hydrophytes are frequently finely divided, as in the water milfoil and mermaid weed. In many cases where the leaves are not finely divided, they are very thin, consisting of one or two layers of cells only, e.g. in tape grass. An examination of the structure of the leaves shows the entire absence of stomata in the submerged parts, an absence of air spaces in most of the ribbon-like forms, complete or almost complete absence of palisade cells, and a very thin epidermis which contains chlorophyll. In contrast with submerged leaves those floating upon the surface of the water usually have well-developed palisade cells, many stomata upon the upper side, and an abundance of intercellular air spaces. The stems suffer a noteworthy reduction in the size and development of the water-conducting vessels and mechanical tissues and a great increase in air spaces. The structures just described are found in their highest development in submerged water plants. Hydrophytes whose leaves are aerial show no conspicuous differences from ordinary land plants in most respects. One class of hydrophytes, which may perhaps be called amphibious plants, shows some remarkable variations, especially in structure. Leaves which are developed under the water show the characteristic structures outlined above, including the fine leaf division, whereas leaves of the same plant developed in the air show typical aerial leaves without these divisions and with palisade cells, stomata, and a thick cuticle. The stimulus or stimuli which cause these wide variations are not certainly known, but they are discussed to some extent in the article **LEAF**. Common American plants, which show variations to a high degree, are the aquatic buttercups, the mermaid weed, some of the cresses, and water hemlocks.

However the hydrophytic structures that have been described in the preceding paragraph may have arisen, certain advantages can be clearly seen, at least in some cases. The thin walls of the epidermis, which are in striking contrast to the thick cutinized walls of many aerial leaves, permit the easy entrance of water and substances dissolved in the water. On this account many

submerged plants are practically independent of soil relations, they take in most of their material directly from the water. It is easily possible to grow cultures of many of these plants without having any root connection whatsoever. While certain forms, such as the water milfoil and the water weed (*Elodea*), develop roots in ordinary aquarium cultures, other forms, such as hornwort (*Ceratophyllum*), never develop roots and yet grow quite as vigorously as in their natural rooted condition. A few forms, such as the bladderwort (*Utricularia*) and some of the duckweeds, have no roots in nature. Of course, in such cases the entire absorption of nutriment must take place through the leaf epidermis. The fact that the leaf epidermis contains chlorophyll is also a matter of advantage, since water very soon destroys the efficiency of rays of light. At a comparatively shallow depth there is a cessation of the development of green plants. A reduction in the water-conducting tissues, while not necessarily an advantage, is, nevertheless, not harmful, inasmuch as the absorption is so largely through the leaf, instead of the root as in land plants. The reduction in root development is not so easy to understand, since it would seem that holdfast organs would ordinarily be of advantage, then, again, any absorption which the roots might make would so much the more increase the capacity of the plant. A high development of air cavities is a distinct advantage, not only to help float the plant, but probably to a much higher degree to act as a sort of air storage. It can readily be seen that the conditions for obtaining air underneath the water are not of the best, and that any additional means for obtaining or for storing air would increase the plant's efficiency. The reduction in the development of mechanical tissues, of palisade cells, and of stomata is not necessarily an advantage to water plants, but since these tissues are not actually needed, the plant loses nothing by its failure to develop these structures. The peculiar leaf forms that have been noted above are, perhaps, not necessarily of any exceptional advantage. It must not be supposed that everything in a plant can be explained in accordance with the need of the plant. It is much more likely that the explanations should be referred to definite chemical and physical causes. However, in the case of finely divided leaves, it can be seen that a much larger proportion of cells comes in contact with the material than is true with the more compact air leaves. Thus, the absorption capacity of the leaf is increased. Finely divided leaves are also doubtless more able to escape the dangers coming from currents of water than leaves which are more compact.

The hydrophytic plant societies are essentially all edaphic, i.e. they are conditioned by local causes. In this respect there is a wide contrast as compared with the xerophytic plant societies. Perhaps some of the ocean formations may be conditioned by climatic causes to some extent, but the ordinary hydrophytic societies of swamps and ponds are due to essentially local conditions. Perhaps no plants have such a wide distribution as certain of the hydrophytes. This is particularly true of ocean plants, where it can easily be accounted for by the almost universal distribution of the oceans themselves. It is true, to a striking degree, as well of the pond and swamp plants. Such plants as the pond weeds, cat-tails, and bulrushes are found almost throughout the world where the habitats are favorable. the chief reason for the wide distribution of hydrophytic species is the great ease of dispersal by means of the water itself, but a reason, almost if not quite as important, is furnished by the wide degree of uniformity of hydrophytic conditions. Since water is colder in summer and warmer in winter than adjoining portions of the land, it is obvious that water plants can, for reasons of temperature, have a much wider distribution than land plants.

The hydrophytic plant societies may be roughly subdivided into those associated with salt water and those with fresh water. The former are treated under the heads PLANKTON, BENTHOS, MANGROVE SWAMP, and HALOPHYTE, the latter under the head of SWAMP, where it will be convenient, not only to treat the swamps proper, but also to some extent the development of the swamps from ponds and lakes. HYDROSTATICS (from Gk *ὑδρ-, hydr-,* water + *στατός, statos,* causing to stand, from *σταίω, histanai,* to stand). That branch of mechanics which treats of the properties of liquids in equilibrium and of solids either totally or in part immersed in liquids. Many of the laws and phenomena of hydrostatics apply equally well to both liquids and gases, i.e., to fluids. A fluid may be defined to be such a form of matter that it yields to any force, however small, which acts to make one layer of the substance move over another, thus, the shape of a liquid or gas depends entirely on the forces acting on it, however small, and not on the body itself, as in the case of a solid. A portion of liquid left to itself—as a falling drop—assumes a spherical shape owing to the contraction of the surface layer. (See CAPILLARITY). Under the action of gravity a liquid contained in an open vessel takes the shape of the vessel so far as all the surface is concerned, except that portion in contact with the air and the portions near the edges of this “free surface.” This surface is horizontal, being perpendicular to the vertical force of gravity if the liquid is at rest, because, if it were inclined to this, there would be a component of gravity tending to make the higher portion of the liquid slide down. When a fluid is said to be at rest, it is not implied that there is no motion of the molecules, but simply that there is no *flowing*, i.e., no currents, no wind. In the case of the open vessel there is a force pressing down on the free surface due to the weight of the atmosphere, and, since the liquid presses against the solid walls, they have a force of reaction against the liquid, thus, it is exactly as if the liquid were contained in a vessel and a tight-fitting piston were pressing down on its top surface. If a gas is contained in a balloon or in a room, it expands and is uniformly distributed throughout the space open to it, it presses against the containing walls, and they have an equal reaction on the gas. If a small quantity of a certain liquid is poured into a tall cylindrical vessel, then another liquid with which the first does not mix is poured carefully on top of this, etc. the equilibrium—if there is any—will be stable only if the density of any one liquid is less than that of the liquid below it and greater than that of the one above it. For, if the density of any layer is greater than that of

the one below it, the potential energy of the two will be decreased if the heavier liquid gets to the bottom and so comes closer to the earth.

Fluid Pressure As a result of the reaction of the containing walls on a liquid or a gas, there is always a “pressure” at each point throughout the fluid, i.e., there is a force acting over any surface immersed in the fluid, the numerical value of the pressure over any area is by definition the force per square centimeter, and the “pressure at a point” is the limiting value of the force acting on any surface at that point divided by the area of the surface, as the area is supposed to be taken smaller and smaller until it becomes practically a point. This pressure due to the reaction of the walls is the same for all points in the fluid. There is also an additional pressure at each point of a fluid on the surface of the earth owing to the fact that any horizontal plane passing through that point has to support the *weight* of the column of fluid vertically above it. If the area of this plane is A , the vertical height above it to the top of the fluid, h , the average density of the fluid, ρ , the acceleration due to gravity of a falling body g , the upward force will be ρghA , and therefore the pressure is ρgh . These two pressures are the only ones which affect our senses or produce mechanical effects in general, but there is also, of course, at any point in a liquid what may be called “cohesion,” or pressure due to the action of the molecules on each other. Some idea of the magnitude of this may be obtained by separating the molecules, e.g., by boiling the liquid. It is greatly affected by dissolving substances in the liquid. The pressure against any surface immersed in a fluid at rest is always at right angles to it, otherwise there would be produced a *flowing* owing to the component of the pressure along the surface. Further, the pressure at any point in a fluid at rest is the same in all directions, because, if it were greater in one direction than in another, the fluid would flow. Therefore the pressure at any point in a fluid at rest is the sum of the pressure due to the reaction of the walls, P , and that due to gravity, ρgh . As noted above, the former is the same for all points in the fluid. As a consequence, if a fluid is inclosed in a cylinder into which fit two pistons of different areas, A_1 and A_2 , the forces which must be applied to these pistons from without to prevent the fluid from pressing them outward are PA_1 and PA_2 , omitting any action of gravity. Therefore, if A_1 is small compared with A_2 , the force on the former piston is small compared with the balancing force on the latter, so a small force may produce a large one. In a liquid which is almost incompressible, P may be very great, and so the force produced may be enormous, but in a gas, which is easily compressed, P is never very large, and so the force produced is small. This principle is that of the hydrostatic press. See HYDRAULIC PRESS.

The total pressure, i.e., $P + \rho gh$, at all points in the same horizontal level in any one fluid, regardless of the shape or size of the containing vessel, is the same, for imagine a vessel with a horizontal bottom, all points of the fluid along this must have the same pressure, otherwise the fluid would flow, the pressure at any point at a level h centimeters above this bottom plane is less than that at the bottom by an amount ρgh —the same for all points in the plane. If, now, portions of the vessel are imagined removed so as to leave a vessel of any shape, the pressure at

the various points remains unaffected. The pressure on any portion of the containing walls varies with the depth, so the thrust outward on this portion is the resultant of a series of parallel forces, increasing from top to bottom, the point of application of this resultant is called the "centre of pressure" (q_v). If the wall is a vertical rectangle, the centre of the pressure, due to gravity, for a liquid, is at a distance one-third the height from the bottom, etc.

Archimedes' Principle. If a solid is completely immersed in a fluid, the latter exerts on it pressures from all directions perpendicular to the elementary portions of the surface of the solid. These pressures will produce an upward force on the solid equal to the weight of the fluid displaced by it, because, if the space occupied by the solid were to be filled with the fluid, there would be equilibrium, and, as this substitution has not changed the pressures at the boundary surface of the volume formerly occupied by the solid, the resultant of these surface pressures must just balance the weight downward of the fluid. This buoyant force acting on the solid must then equal the weight of the fluid displaced by the solid and must have a vertical line of action passing through the centre of gravity of the displaced fluid. This is called "Archimedes' principle." The apparent loss in weight of a body immersed in water, the suspension of a balloon, etc., are illustrations of it. It evidently gives a method for comparing the density of a solid with that of a liquid, for the weight of a solid in a vacuum is $\rho g v$, if ρ is the density of the solid and v its volume, and its apparent loss in weight when weighed suspended in the liquid is $\rho' g v$, if ρ' is the density of the liquid, both the weight and the loss in weight may be measured, and thus the ratio of ρ and ρ' determined.

Free Surface Waves. Liquids differ from gases in having definite volumes, consequently, as noted before, if a liquid is poured into an open vessel, it will have a surface in contact with the atmosphere. This is called the "free surface." If the liquid is in equilibrium, this surface must be at right angles to the forces acting on it. Thus, a liquid at rest in an open vessel has a horizontal surface owing to the earth's force of gravity. If this surface is disturbed, e.g., by dropping in a stone, the displaced portion will return to its previous level owing to the action of gravity, but its inertia will cause it to continue its motion, making a displacement in the opposite direction, then it will return, etc., thus vibrating up and down and producing waves out over the surface. These gravitational surface waves on a liquid advance with a velocity which depends upon the depth of the liquid and the wave length of the waves. Thus, if the liquid is shallow compared with the wave length, the velocity is given by the formula $v = \sqrt{hg}$, where h is the depth of the liquid and g is the acceleration of a falling body. If the liquid is deep compared with the wave length, the velocity of the waves is

$$v = \sqrt{\frac{g\lambda}{2\pi}},$$

where λ is the wave length of any train of waves and $\pi = 3.1416$. If the waves are extremely short—i.e., ripples—their motion is not due to gravitation, but to capillarity (q_v), because the surface is increased in area by the

ripples, and the capillary forces are in this case large compared with the gravitation ones, the surface being so slightly elevated or depressed. The velocity of these capillary waves is

$$v = \sqrt{\frac{2\pi T}{\lambda \rho}},$$

where T is the "surface tension" of the liquid. (See CAPILLARITY.) If the vessel containing the liquid is cylindrical, and if this is set rotating rapidly about its axis, the free surface will no longer be horizontal, because now the surface is acted upon by both gravity and "centrifugal force." The shape of the surface will be such as to be at right angles to their resultant, and will actually be a paraboloid of revolution.

If a liquid is poured into a vessel which consists of several parts, the liquid will stand at the same height in all parts provided they are wide and open to the atmosphere, for, as has been proved, all points at the same horizontal level in a fluid are at the same pressure, and conversely, and the points in the free surfaces are at the same pressure, viz., that of the atmosphere. If, however, a liquid is poured into a U-tube which stands erect, and then a lighter fluid, which does not mix with the first, is poured into one arm, the level of the surfaces of the liquids in the two arms is not the same. The pressure at points which lie in the horizontal plane passing through the surface of separation of the two liquids must be the same, because they are all connected by one liquid. The pressure at the points in one arm in this level is $\rho_1 g h_1 + P$, where ρ_1 is the density of the liquid in that arm, h_1 is the vertical height of its free surface above the level plane, and P is the pressure of the atmosphere on the free surface, similarly the pressure at this level in the other arm is $\rho_2 g h_2 + P$, where ρ_2 is the density of the liquid whose vertical height from the level to the free surface is h_2 . Therefore

$$\rho_1 g h_1 + P = \rho_2 g h_2 + P,$$

or

$$\rho_1 h_1 = \rho_2 h_2$$

Thus principle evidently furnishes a method for the comparison of the densities of two liquids which do not mix.

Flotation. If a body less dense than a liquid is immersed in the liquid and allowed to come to equilibrium, it will rise to the surface and "float" with only part of its volume below the surface. By Archimedes' principle the upward force equals the weight of the liquid displaced, and, since the body does not move in a vertical direction, this force must equal the weight of the body itself. Therefore a floating body displaces a volume of the liquid of weight equal to its own. The upward force acts through the centre of gravity of the space formerly occupied by the liquid displaced, while the downward force acts through the centre of gravity of the floating body. If the body is in equilibrium, these two forces must have the same line of action, i.e., the two centres of gravity must lie in the same vertical line. In most cases this equilibrium is stable, but it may be unstable, e.g., an oblong block set floating with its long direction vertical. The test of stability is to give the floating body a small displacement, i.e., tip it slightly, and to see if the forces acting on it tend to restore it to its previous position or to make it tip still further. See METACENTRE.

Capillarity. Where the free surface of the

liquid meets the wall it is not horizontal, and when a tube of fine bore dips into a liquid the free surface inside the tube is at a different level from that outside. These variations are said to be due to capillary action, and they may all be shown to be due to the fact that a liquid surface contacts so as to have the smallest area compatible with existing conditions. See CAPILLARITY.

The principle of Archimedes, discussed above, is attributed correctly to the philosopher of Syracuse, and many facts in regard to liquids were known to him and other scientists of antiquity. Galileo first stated the law of connecting tubes, and Pascal was the first to recognize the fact that the reaction of the walls produced a pressure which was the same at all points throughout the fluid. The ordinary statements and proofs of hydrostatics are given to-day exactly as they were by Stevinus (1548-1620). For further information, consult Greenhill, *Hydrostatics* (London, 1894), S. L. Loney, *Elements of Hydrostatics* (2d ed., New York, 1900), E. S. Gould, *Practical Hydrostatics and Hydrostatic Formulas* (ib., 1903), G. M. Minchin, *Treatise on Hydrostatics* (2d ed., Oxford, 1912).

HYDROSULPHURIC ACID. See SULPHURETED HYDROGEN.

HYDROTHERAPY (from Gk *ὕδωρ*, *hydōr*, water + *θεραπεία*, *therapeia*, cure, from *θεραπεύω*, *therapeuō*, to cure, from *θεράπων*, *therapōn*, attendant). The use of water as a remedial agent. The efficacy of water in the cure of numerous forms of disease has long been recognized. Water was largely employed by Hippocrates in the treatment of many kinds of disease. Horace speaks of Antonius Musa, the hydropathic physician of the Emperor Augustus (*Epist.*, i, 15). Both Celsus and Galen speak favorably in their writings of the use of water in the cure of disease, regarding it as of high value in the treatment of acute complaints, particularly of fevers. Throughout the Middle Ages, likewise, many physicians, including Aetius, Paulus Aegineta, and Paracelsus, were advocates of the remedial virtues of water, all of them, however, having faith in its uses in the treatment rather of acute than of chronic disorders. In 1723 Niccolò Lanzi, a Neapolitan physician, published a learned treatise on the subject. In England, about the beginning of the eighteenth century, Sir John Floyer and Dr. Baynard made large use of water. Their conjoint work, denominated *Psychiculousia*, or the "History of Cold Bathing, both Ancient and Modern," is replete with quaint learning and practical shrewdness and sagacity. But the most able and scientific among the older treatises that have appeared in England on the subject of the water treatment is the work of Dr. Currie, published in 1797, entitled *Medical Reports on the Effects of Water, Cold and Warm, etc.* In this work Currie recommends the cold affusion in typhus and other fevers and gives practical directions in regard to the cases and the times when it may be used with advantage, although he appears to have limited his use of water to acute ailments exclusively.

We have thus seen that up to the beginning of the nineteenth century, by some of those who employed it as a curative agent, water was used in the treatment of acute, and by others of chronic, diseases, by some as an internal agent alone, by others as an external application in the various forms of the bath, but never in all the manners combined. This combination was

first effected by the original genius of Vincent Priessnitz, a Silesian farmer, with whom began a new era for the water cure. It was owing, we are told, to his successful treatment of more than one bodily injury which he had sustained in his own person that, about the year 1820, Priessnitz became so convinced of the curative powers of water as to employ it medically in the cure of others. Beginning with the external application of water for trifling diseases among the poor of his neighborhood, he gradually undertook an extended range of cases and multiplied the modes of administration, introducing the wet compress, the douche bath, partial baths of all kinds, the sweating process, the wet sheet, together with copious drinking of pure water. In addition to water in all these forms, he insisted on the value of exercise, diet, fresh air, and mental repose in the cure of disease, thus practically calling to his aid the entire resources of hygiene, and establishing, by a simple yet thoroughly original combination, nothing less than a new system of medical treatment. As to the success which attended Priessnitz's practice, it is an historical fact that of 7500 patients who had gone to Grafenberg for advice and treatment up to the year 1841, or within the space of about 20 years, there had been only 39 deaths. It is to be regretted, however, that the founder of the new system was not an educated physician, so that he could have understood better the philosophy of his own practice and explained it more correctly. He would not have called his system the "water cure," a name scientifically one-sided and incomplete and therefore misleading.

The undoubted merits of hydrotherapy at length called to its defense many men of standing in the profession, who, allowing for some of its early extravagances, explained it scientifically, and from their advocacy has sprung up a school of hydropathic physicians. Dr. Winternitz, of Germany, in 1883 laid down the scientific principles of modern hydrotherapy. The fundamental principles of hydrotherapy are very simple. The art of applying these principles requires much teaching, but any one with even moderate sense and intellect can grasp the essential features. Water may be used either internally or externally. Internally it may be used simply to wash out a cavity—the nose, the mouth, the stomach, the bladder, or the rectum. In addition, it may be taken internally hot or cold and passed into the blood. It may be used hot in the rectum, as a simple enema, or for purposes of stimulation. Externally water may be used in many conceivable ways, but essentially the use of water means with it the use of two very necessary aids, heat and cold. Hydrotherapy, apart from the use of heat and cold, is of secondary importance. The action of water in the treatment of disease is therefore largely mechanical. The psychical side is not unimportant. It has been used by enlightened physicians ever since the dawn of medicine, and its effects taught in all medical schools. Only the quack and the charlatan will claim that hydrotherapy is a cure-all. Eccentricities, like the Kneipp cure and others, are to be avoided by the sensible. Water acts physically and mechanically. It is capable of readily taking up heat and of giving it up, it thus lends itself most readily to the use of thermal agents. It may be used in gaseous form (steam), liquid form, or solid form (ice). The action of heat and cold is essentially important. Smooth muscle fibre expands under the action of

moderate heat and contracts under the influence of cold. Its contracting power may be destroyed by an excess of either. Cold and heat therefore act as irritants to the nervous system, and through their agency we can act upon all of the organs, to stimulate or depress their activities. The heart, lungs, kidneys, liver, spleen, skin, etc., may all be influenced, the body heat and the output of moisture and secretions may be regulated. Thus, by the use of heat or cold to certain portions of the skin or internally, almost every organ in the body can be influenced through its blood vessels, and the skilled physician can, by guiding and directing these effects, bring about changes in vascular states, can remove excess of blood from one part of the body and bring it to another, can impart tone to a flagging organ, as the heart, or to the muscles or to the spinal cord, can increase the secretions from organs, such as the skin or the kidneys, and thus assist in excreting poisonous products from the body.

Chief among the eminent exponents of hydrotherapy in Europe are Kisch, professor in the University of Prague, Strasser and Buxbaum of Vienna—the former of the University of Vienna, the latter chief of the Hydrotherapeutic Institute. In the United States, besides Baruch of New York, Eshner of Philadelphia, Hinsdale of Hot Springs, Va., and Kellogg of Battle Creek, Mich., are well known.

The applications of water to disease are well systematized by Baruch as *ablution*, *affusion*, *sheet bath*, *drip sheet*, *compresses*, *wet pack*, *tub bath*, and *douche*.

Ablution. Simple application of water by the hand or moist cloth over the body. In fevers the abdomen, the back, the chest, the lower extremities as far as the knees, are bathed successively every two or three hours. A temperature of 75° F. should be used at first and gradually reduced to 60° F. Chilling is to be avoided. Reaction is to be gained, the superficial capillaries becoming suffused and the body assuming a pinkish hue. Rubbing should always be used in ablutions.

Affusion. The patient, with a cold wet cloth about the head, sits or stands in a tub containing about a foot of water at 100° F. A broad stream of water from a bucket or pitcher is poured with force directly over the body. The stimulation will depend upon the temperature of the water and its force of delivery. This is often used in states of profound prostration, in coma, and in stuporous, delirious states.

Sheet Bath. A rubber sheet is laid down over one half of the bed. This is covered by a blanket. Then a linen sheet is dipped in water at a temperature of from 60° to 70° F., and while still wet is wrapped about the patient while he lies upon the blanket. The face is bathed in ice water and the head covered with a wet towel. The nurse or attendant rubs the patient energetically over the body. As the body reacts and becomes warm, water at still lower temperatures may be sprayed over the sheet. Afterward the patient may be wrapped up in the blanket. This is an excellent method for reducing temperature in fevers and is applicable in practically all acute diseases accompanied by high temperature.

Drip Sheet. The patient, standing in a tub of water at 100° F., has a wet sheet, wrung out, wrapped about him. He is then firmly rubbed until a reaction occurs. He may be slapped gently instead of being rubbed. This procedure forms an excellent tonic in nervous exhaustion, in the

early stages of tuberculosis, and in chlorosis or anemia.

Compresses. These consist of bands or squares of old linen to which flannel is attached and stings made to fasten the appliance about a part. The linen piece is usually wrung out of hot or cold water and applied to the part and wrapped about by the flannel to prevent evaporation. These compresses are valuable in sore throat, tonsillitis, rheumatism, pneumonia, sprains, etc. They should be renewed hourly in acute processes.

Wet Pack. This is similar to the sheet bath, save that the sheet covering the body is wrung dry and then the patient is rolled up completely in thick blankets. The air should be kept out by fixing the blanket very securely about the feet and neck. The wet pack is more useful in chronic cases. Friction is essential in the acute cases, in order to bring about quicker reaction, hence in these the sheet bath is usually preferred to the wet pack.

Tub Bath. A trained nurse should give this bath. See TYPHOID FEVER.

Hammock Bath, or Continuous Bath. This is a device by which the patient is suspended for periods of time, varying from hours to months, in a bathtub filled with water at a temperature from 95° to 100° F. The procedure is applicable to cases of cerebral excitement, acute mania, delirium tremens and chronic organic diseases of the central nervous system, as well as extensive burns and suppurating wounds. Dr. A. Rose, of New York, has advocated the continuous bath for the treatment of tuberculosis, both of the lungs and bones.

Neuro-vascular Training (Baruch). This consists of the hot-air-cabinet treatment, employed till the skin is relaxed and perspiration is free, being followed by a douching of the body at 95° F., 20 pounds' pressure for one minute. On each successive day the temperature is lowered two or three degrees till 70° F. is reached, after several days.

Douche. This apparatus throws a jet of water against the body from a hose and is best given in a special institution devised for this work. Arrangement is made in the apparatus whereby the force of the jet and its temperature can be regulated.

Marienbad, Franzensbad, Ems, Kissingen, Homburg, Bruckenaue, Aix-les-Bains, Vichy, Harrogate, Bath, and many other European spas present varying water treatments. In this country Mount Clemens, Battle Creek, Hot Springs, Ark., Hot Springs, Va., Colorado Springs, Saratoga Springs, and several other towns provide balneologic possibilities. One of the best known of the hydrotherapeutic procedures is the "Nauheim bath," elaborated by Beneke and the late August Scholt at the German town which bears its name, and administered to many thousands annually. The water used contains in solution various salts and carbonic-oxide gas. The "Nauheim system" consists of a series of graduated baths of decreasing temperatures, besides exact diet, exercise, and rest. In Nauheim salts and gas are added to the later series of baths. Incipient arteriosclerosis, certain kidney disorders, rheumatism, lumbago, neuritis, arthritis, neurasthenia, exhaustion, and especially certain heart disorders are treated with success in very many instances by this system of baths. In Saratoga Springs, N. Y., the natural mineral waters contain a larger gas content than any

others east of the Rocky Mountains, and Saratoga is the only locality in the United States where the Nauheim baths are given with natural radioactive saline water without admixture of gas, under the control of the government of New York State, through a special reservation commission. See SARATOGA SPRINGS.

HYDROTHORAX (Neo-Lat., from Gk *ὑδωρ*, *hydōr*, water + *θώραξ*, *thōrax*, chest) The term applied to dropsical collections in the pleura (qv), a closed serous sac enveloping the lung on either side. When it exists to any extent, the pressure which it exerts on the lungs impedes the passage of the blood through them, occasions difficulty of breathing, and lividity of countenance soon appears. The physical signs by which the disease can be detected by the physician are changes in the condition of the chest, as ascertained by auscultation, percussion, and auscultation.

Hydrothorax may depend upon inflammation of the secreting membrane, or it may be a consequence of organic disease of the heart or lungs, liver, or kidneys. With regard to treatment, when the disease seems to depend upon inflammation of the pleura, great advantage may often be derived from occasional cupping and repeated blistering, hydragogue catharsis, and withdrawing the fluid from the chest (tapping) by means of a hollow needle.

HYDROTROPISM (from Gk *ὑδωρ*, *hydōr*, water + *τροπή*, *trōpē*, a turning, from *τρέπω*, *trēpō*, to turn) The sensitiveness of certain plant organs to the presence of unequally distributed water vapor, which causes them to turn towards or away from the region of greater

rise at right angles to it. If they start from a salient angle on the substratum (e.g., the edge of a slice of bread), they may take the position shown at Fig. 1, growing equidistant from the two moist surfaces. If they arise from a re-entrant angle, they place themselves likewise so

FIG. 2 POSITIVE HYDROTROPISM

Grains of corn, planted in wet sand in a funnel whose outer surface is covered with wet blotting-paper, have germinated. The roots, *r*, instead of growing straight down, as they would do in saturated air, have applied themselves to the wet paper. Hydrotropism under these conditions overpowers geotropism.

FIG. 1 NEGATIVE HYDROTROPISM

Culture of the black mold on bread in a moist chamber. The hyphae carrying the beadlike sporangia grown in such directions as to be as far as possible from the surfaces of bread and glass from which moisture is diffusing. Diagrammatic.

density. Among the fungi hydrotropism is shown particularly by those filaments (hyphae) which bear the sporangia. While most of the hyphae ramify through the moist substance on which the fungus grows, the sporangial hyphae

as to be as far away from each moist surface as possible. The roots of higher plants are also sensitive to moisture, the stimulus of which may exceed that of gravity, as shown in Fig. 2. Here roots of corn planted in the heaped-up sand have come over the edge of the glass funnel and have started to grow downward in the moist air. As they get farther from the surface of the wet paper covering the outside of the funnel they find drier and drier air. A stream of water particles, however, is reaching them from one side. At a certain point the stimulus of the diffusing moisture overcomes the geotropism (qv), and the root, growing more rapidly on one side, is directed towards the moist surface. When it comes into the neighborhood of the moist paper again, the sides are less unequally stimulated, the stimulus of gravity reasserts itself, and the tip again grows downward. The alternating prevalence of hydrotropism and geotropism is shown in the wavy course of the longer roots. It will be observed that the more rapid growth which directs the tip towards the moist surface is not due merely to the absorption of water, for it occurs on the drier side of the root. It is an induced process involving growth. Hydrotropism is a form of chemotropism (qv).

For hydrotropism in animals, see TROPISM.

HYDROZOA (Neo-Lat nom pl, from Gk *ὕδωρ*, *hydōr*, water + *ζῷον*, *zōon*, animal) A class of *Cœlenterata* in which the simplest form of the body, as in the polyps, is a sac attached by its posterior end, and with a digestive cavity communicating with the exterior by a mouth only. The mouth is surmounted by hollow tentacles. The body is composed of two cellular layers, the ectoderm and endoderm, separated by a gelatinous, noncellular "mesoglea". The body is usually differentiated into two sorts of zooids, i.e., "polyps," or nutritive zooids, which are usually sexless, and "medusæ," or reproductive zooids. The latter produce medusæ buds, which on being set free are called medusæ and are bisexual. In these medusæ the body is greatly more complicated than in the polyps, being bell or umbrella shaped, with a well-developed nervous system, composed of a thread running around the eye of the disk and with ganglia near the "eyes," or sense organs. The digestive cavity is differentiated into a central and a peripheral portion, the latter forming radial and circular canals. The eggs and sperm are discharged externally, and fertilization of the egg takes place in the sea. Netting organs (see *NEMATOCYST*) are usually present; they arise from some of the interstitial cells and are most abundant in the tentacles. Many Hydrozoa (*Hydra* excepted) exhibit the phenomenon of alternation of generations (q.v.). The asexual polyps give rise to buds which develop into medusæ, and the latter lay the eggs from which are hatched the polyps. The medusæ are more or less phosphorescent. They abound in all seas, while *Hydra* is a minute fresh-water form. Very primitive fresh-water forms are *Protohydra* and *Microhydra*, which are without tentacles.

The Hydrozoa are grouped in five orders: (1) Leptothecæ, having a fixed zoophyte or polyp stage, and the sense organs exclusively ectodermal (Anthomedusæ and Leptomedusæ), (2) Trachylinæ, having no fixed zoophyte stage, all being locomotive medusæ (Trachymedusæ and Narcomedusæ), (3) Hydrocorallina, coral-making polyps (*Millepora* and *Stylaster*), (4) Siphonophora, pelagic hydroids in polymorphic colonies, (5) *Graptolithoidea*, which are an extinct Paleozoic group.

The term *Hydromedusa* is often used as synonymous with orders one and two above. In some species only the free living, in others only the fixed, stage occurs. In the majority there is an alternation of the one stage with the other in the life history. The Scyphomedusæ are larger and more complicated in their structure than the Hydromedusæ and belong in class Scyphozoa.

Of the orders above mentioned, the Hydrocorallina and *Graptolithoidea* are of importance to the geologist, for they contain fossils of considerable interest. See *STROMATOPORA*, *GRAPTOLITE*.

Huxley, *Oceanic Hydrozoa* (London, 1859), Parker and Haswell, *Text-Book of Zoology* (New York, 1897); Fowler, "The Hydromedusæ and the Scyphomedusæ," in Lankester's *Treatise on Zoology*, part ii (London, 1900), S. J. Huxson, "Cœlenterata and Ctenophora," in *Cambridge Natural History*, vol. 1 (ib, 1906). See *CORAL*, *CTENOPHORA*, *HYDRA*, *HYDROID*, *JELLYFISH*, *MEDUSA*, *POLYP*, *SIPHONOPHORA*, ETC.

HYENA, hi-ē'na (Lat *hyæna*, from Gk *ἡἡνα*, *hyæna*, hyena, from *ἡς*, *hys*, hog, Lat *sus*, AS., OHG *sū*, Ger *Sau*, Eng *sow*, Av *hu*, pig, connected either with Skt *sū*, to bear, or with Skt

sākhya, swine, *sū*, make), so called from the grunt). One of a family (*Hyænidæ*) of carnivorous animals remarkable for their generalized structure, which unites features characteristic of the cats, the civets, and the dogs. Their den-

DENTITION OF HYENA

i, incisors, c, canine, p, premolars, m, molars

tation is calculated for great tearing and crushing power and includes six incisors and two canine teeth in each jaw, five molars on each side of the upper jaw, and four in the under. This dentition and other features place them between the dogs and the civets, with the latter of which they are connected by *Proteles*. (See *AARD-WOLF*.) They seize an object with so firm a hold that among Arabs they are proverbial for obstinacy. The vertebrae of the neck sometimes become ankylosed in old hyenas. In size they equal the largest dogs. The hind quarters are lower and weaker than the fore quarters of the body, so that hyenas move with a shambling gait. The body is covered with long coarse hair, forming a mane along the neck and back. The feet have each four toes. The claws are strong, fit for digging, and not retractile. The tail is short. Beneath the anus is a deep glandular pouch, contributing much to the offensive odor which is one of their many disagreeable characteristics. Hyenas eat carrion as well as newly killed prey and are of much use, like vultures, as scavengers, clearing away the last remnants of carcasses. They sometimes attack cattle, especially if they flee, but rarely man, though they sometimes seize children. Selous gives surprising instances of their boldness and strength in East Africa. During the day they hide themselves in caves, old rock tombs, and ruined edifices, by night they roam singly or in packs. They prow about towns and villages, and often dig up corpses that have not been deeply buried. This habit, together with their aspect, has caused them to be generally regarded with horror, and very exaggerated accounts of their fierceness have been prevalent. Instead of being untamable, as was long the popular belief, they are capable of being completely tamed and show an attachment to man similar to that of the dog, they have even been used as watchdogs. Hyenas are found only in Africa and in south Asia.

The most typical and at the same time familiar form is the striped hyena (*Hyæna hyæna*, or *striata*), which ranges from Abyssinia and the Libyan Desert eastward to India, where it is common throughout all the more open country, roaming widely at night in search of carrion or living sheep and dogs. It is dirty gray, with narrow tawny or zebra-like stripes, a coarse mane along the back, and a bushy tail. It is cowardly, silent, and both hated and feared by the rural people. Two other species are exclusively African and differ much from the striped, so that some naturalists put them in another genus (*Crocuta*). The spotted hyena (*Hyæna*, or *Orocuta*, *crocuta*) is larger than either the striped or the brown and is yellowish, thickly spotted with black, with nose and feet dark. It inhabits nearly all Africa south of the Sahara, hunts in packs, is courageous, and really does

HYENAS AND PROTELES

1. AARD-WOLF (*Proteles laurii*).
2. STRIPED HYENA (*Hyæna hyæna*).

3. BROWN HYENA (*Hyæna brunnea*).
4. SPOTTED HYENA (*Crocuta crocuta*).

most of the ravaging it is accused of. Its unearthly coughing cry is one of the most terrifying of animal utterances. Owing to the peculiar arrangement of the reproductive organs in this species, it is extremely difficult, except by careful examination, to distinguish the sexes by external characters, and from this fact the old myth that hyenas are hermaphrodites has doubtless arisen.

Median in size stands the brown hyena (*Hyena brunnea*), found on both sides of southern Africa near the coast and often on the mountains. It is a less repulsive-looking animal than the others, has a doglike mantle of long brown hair which half conceals its barred legs, and becomes white on the sides of the head and chest, giving a quaint appearance to the front view, since the face itself is black, while the tall ears are gray.

The hyena family, of comparatively recent origin, appears to have evolved from the Viverridae, through such an intermediate genus as *Ictitherium* of the Lower Pliocene of southern Europe. That *Ictitherium* ate bones in the same manner as do the modern hyenas has been proved by the nature of the coprolites found associated with their skeletons. True hyenas are common fossils in the Pliocene and Pleistocene deposits of Europe, during which periods they roamed in abundance as far north as France and England, as is exhibited by their remains in cave floors, and they are known in deposits of similar age in Asia. None have been found in America.

Blanford, *Geology and Zoology of Abyssinia* in 1867-68 (London, 1870), id., *Fauna of British India Mammals* (ib., 1888-91), Richard Lydekker, *The Game Animals of Africa* (ib., 1908), Roosevelt and Heller, *Life-Histories of African Game Animals* (New York, 1914), and the writings of sportsmen travelers in Africa and India. See PLATE of HYENAS.

HYENA DOG See HUNTING DOG.

HYÈRES, e'ar'. A town in the Department of Var, France, 3 miles from the Mediterranean and 8 miles east of Toulon (Map France, S, L 5). It is a fashionable winter resort, picturesquely situated on the south slope of a castle-crowned hill 670 feet high, in a district noted for its mild climate and luxuriant vegetation. Its chief buildings are the restored twelfth-century cathedral church of St. Louis, the hôtel de ville, public library, theatre, zoological garden, and museum. There is a considerable export trade in flowers, fruits, cork, and salt. The extensive salt marshes in the vicinity employ 300 people and yield more than 40,000 tons annually. In mediæval times, as Hiedera, Hyères was a favored port of call for Oriental pilgrims and as late as the fourteenth century was of greater importance than Toulon. Pop., 1901, 17,659, 1911, 21,339.

HYGEIA, hi-gē'ya, or **HYGIEIA**, hi-gi-ē'ya (Lat. from Gk. *Ἥγεια*, *Hygeia*, *Ἰγία*, *Hygieia*, health, from *ὑγιής*, *hygiēs*, healthful). In the ordinary Greek tradition, which does not antedate the fifth century B.C., the goddess of health, daughter of Asclepius (see **ÆSCULAPIUS**), and honored with him at Athens, Epidaurus (after 420 B.C.), Sicily, Corinth, Titane (in the territory of Sicily), and elsewhere. She was joined with the god of healing, Amphiaraus, at Oropus. On the Acropolis at Athens there was an ancient cult of Athena Hygeia, to whom a statue and altar were erected after the great plague (430 B.C.) and before the introduction of the

worship of Asclepius in Athens. In the art of the fifth and fourth centuries B.C. Hygeia is represented as a maiden, but of the fully developed and vigorous type, while later her form is more youthful and girlish. She is represented in company with her father, or sometimes alone, with the snake by her side or drinking from the patera in her hand. Hygeia seems to have been originally an abstraction, later converted into an independent divinity, who came into connection with various deities associated with the cure of disease. In 293 B.C. her cult was introduced into Rome along with that of *Æsculapius*, at Rome she was known also as *Vale tudo* (health) or *Salus* (safety). Consult the article "Hygiea," in Roscher *Lexikon der griechischen und römischen Mythologie*, vol. 1 (Leipzig, 1884-90).

HYGIENE, hi'ji-en (from F1 *hygiene*, from Gk. *ὑγιαίνω*, *hygiainein*, to be healthy, from *ὑγιής*, *hygiēs*, healthy). The branch of medical science which deals with the preservation of health. Within its scope are all measures taken for the acquisition and preservation of health, except those involving purely medical and surgical means. Hygienic measures were a part of religious observance among the Jews as well as among the people of Assyria and India, and their enforcement lay with the priests. Among the Greeks these duties were transferred to the physicians. Hippocrates' work on *Air, Water, and Places* was largely responsible for this change. (See **HIPPOCRATES**.) In the twenty-second book of Homer's *Odyssey* there is an account of the sanitary precautions taken by Ulysses after the killing of the wooers. The place of slaughter was cleansed and disinfected by scraping and washing and by burning sulphur. Little attention appears to have been paid to the infected individual in the plague time, when the panic ensuing upon a plague caused expulsion or expatriation of the sufferers. Laws were framed to protect the public from lepers, e.g., by expelling them and burning their houses. In 1423 Venice established its first lazaretto, and in 1485 a permanent health magistracy was created in that city. In 1532 an Act of Parliament authorized in England the issue of commissions of sewers for "the overlooking of sea banks and sea walls, and the cleansing of rivers, public streams, and ditches." In 1552 Shakespeare's father was fined for throwing filth into the street and again in 1558 for not keeping his gutter clean.

Roman law provided no protection for the individual. Greek and Latin writers treated of diet and exercise for the patrons of literature, for princes, and for the wealthy. From the school of Salernum, about the twelfth century, issued the *Code of Health*, which was printed in 1480 and for two centuries thereafter remained the standard work on personal hygiene. Despite the stringent laws seeking to prevent plague which were enacted by James I, and the establishment of lazarettos into which ships discharged their cargoes for detention and airing, serious outbreaks of the dread disease occurred in 1625 and 1629-31. In 1665, according to Macaulay's estimate, the number of deaths from plague during one period of six months reached more than 100,000.

At the close of the eighteenth century little advance had been made in hygienic knowledge beyond the discovery by Woodhall, in 1617, that scurvy was prevented by the use of lemon juice,

the discovery by Morton, in 1697, that foul air produced disease in some way, and the introduction from Turkey into England in 1717 of inoculation with smallpox virus by Lady Mary Wortley Montagu. Differentiation of fevers began early in the nineteenth century. Following the cholera epidemic in London of 1831-32, newly awakened interest resulted in the formation in 1838 of a system of registration of deaths in that city. The establishment of the fact of water-borne diseases was made by the investigations of Dr John Snow into the cholera outbreak in London in 1848-49. From this date investigation has been systematically pursued into the causes of death, the causes of disease, its spread, and the agencies that produce it, and into the conditions that promote health. The use of the microscope, the study of bacteriology, of pathology, of the chemistry of food, of climate, and of exercise, have all added to the knowledge that has increased the useful application of hygienic principles in our day. Sanitary laws have been enacted which control unhealthful agencies and aim to safeguard and regulate commercial as well as domestic relations.

Hygiene may be variously classified, according to its relations and the objects in view. There is the hygiene of the individual, of the family, and of the municipality or state, which may be denominated personal, domestic, and public hygiene.

Personal Hygiene. This includes the study of (1) *Food*, including water and beverages. Food should be adapted to the season of the year, the age, occupation, and the condition of health of the individual. An increase in the quantity of fruit and of water, a greater proportion of vegetables, and smaller meals are desirable in hot weather, while an increase in meat and in cereals is desirable in cold weather. Infants require principally milk, with the proportions of proteids, fats, and sugar graded according to age and digestive capacity. Older children require small quantities of meats, cereals, fruits, and vegetables. In regard to occupation, it may be said in general that active laboring men, like carpenters, blacksmiths, and farmers, may partake of food which takes a considerable time to digest, with more advantage than sedentary men may. Pork and corn cake or bread is a nutritious and sustaining diet to an active laborer, but should not form the habitual diet of a sedentary person. (See DIET, paragraph *Diet in Disease*, see also FOOD.) The investigation of water supply, examination for noxious ingredients or medicinal properties in drinking water, as well as directions for its use, come within the province of hygiene, as does also the use of coffee and tea, which are both stimulating drugs, causing in some persons overaction of the heart, cerebral activity resulting in insomnia, and indigestion, of cocoa, which is slightly stimulating, but contains food, of wine, beer, and distilled liquors, all of which are drugs in the eyes of the physician and the sanitarian, to be used with accurate calculation of their nutrient and stimulant properties. (See ALCOHOL, PHARMACOLOGY, TOXICOLOGY, AND THERAPEUTIC USE.) (2) *Clothing* should be suited to the temperature, age, and occupation. Ventilation as well as materials—wool, cotton, linen, and silk—must be considered. (3) *Work and Exercise* are necessary for every one. Regular physical activity is essential to proper development and to the maintenance of normal action of the vital organs and

the repair of tissue. Even those who are confined to bed by disease need exercise, which is secured by passive motion or massage. (See GYMNASTICS, EXERCISE, MASSAGE.) To work must be joined the consideration of rest and sleep, which should be enjoyed at regular intervals and in quantities proportioned to individual conditions and occupations. (See SLEEP.) (4) *Personal Cleanliness* includes regular evacuations of the bowels daily, daily bathing, securing constant removal of perspiration, care of the hair and scalp, and care of the nostrils, of the cavity of the mouth and teeth, of the genitals, and of the anal orifice. (5) *Special Habits* which tend to undermine health should be controlled, the use of tobacco, of other narcotics, and of stimulants should receive consideration. Tobacco should never be used before the age of 21 or 22 years has been reached and should rarely be used by neurasthenics. In certain diseases, as Bright's disease and syphilis, and certain conditions of the heart, tobacco is pernicious. All other narcotics are distinctly deleterious and should be forbidden. (6) *Control of Sexual and Other Passions* has much to do with personal health. Indulgence in masturbation by the young delays development and in many cases causes mental enfeeblement. Excessive sexual intercourse has a similar effect, with greater disaster to the male. Perhaps the most undermining of normal mental activities are anger and grief, and these should be avoided or limited. The thoughts should be calm, and mental exercise, as well as physical, should be regularly taken. Mental indolence leads more often to mental disorder than does mental overwork.

Domestic Hygiene. This includes the study of (1) *the Management of Infancy*, (2) *Preparation of Food*, with regulation of meals, as well as supervision of cooking, and (3) *the Hygiene of the Sick Room*, including removal of dust-catching furnishings, regulation of heat, light, and ventilation, provision of utensils which may be sterilized, care of bedding and bed linen and arrangements for proper bathing and nursing. Besides these subdivisions, others might be made which would duplicate some of the titles more properly assigned to personal or public hygiene, such as *air*, and *hygiene of the school*. The latter topic will be treated under SCHOOLS, MEDICAL INSPECTION OF.

Public Hygiene. This comprises care of the surroundings of man, as well as prevention of disease, and disposal of the dead, and therefore includes a consideration of (1) *Climate*, as one of the agencies active in man's environment, is used as an elastic term to embrace the range of temperature of a locality, the prevailing winds, the rainfall, the vegetation, and the soil. (2) *The Soil under Dwellings*, with reference to possibilities of drainage, proximity to underground water, etc. (3) *The Character of Dwellings*, especially tenements, as to ventilation, and air space, position, and materials used in construction, and provision for regulating temperature, water supply, and drainage. (4) *Cleaning of Dwellings and Disposal of Refuse*. (5) *Cleaning of Streets* in towns. One of the most important questions of public hygiene is the cleaning of streets, and matters connected therewith. Not only are filthy streets productive of disease by the generation of poisonous gases, but also the dust which results from the long-continued trituration of excrementitious and decaying substances is extremely injurious to the mucous

membrane of the air passages, and productive of contamination to blood and tissue. The habit of casting the sweepings of houses and stores upon the sidewalks, especially during the hours in which pedestrians are passing, is a greater evil than many suppose. The dust of these places is often of the most objectionable character, containing the germs of contagion, and there is no doubt that many "filth diseases" (qv) are propagated in this manner. (6) *Regulation of Public Conveyances*. Public conveyances are frequent causes of disease from various sources. The dust which is allowed to collect in street cars, and also ordinary steam-railway cars, is of itself a frequent cause of diseases of the air passages, but compared to the evils which result from overcrowding and bad ventilation, it is of minor importance. Pneumonia, pleurisy, bronchitis, and laryngitis are common results of street-car exposure. But one of their greatest evils, and one not yet sufficiently recognized by the public, although well known to the medical profession, is the want of attention paid to the smoothness of the track and the springs of the cars. On street cars undue jarring should not be permitted. When they are properly supplied with springs, and when wheels that are flattened are promptly replaced, all injurious vibrations will be avoided. (7) *Control of Air Spaces in Public Buildings*, such as hospitals, asylums, orphanages, lecture rooms, theatres, schoolhouses, etc. The vitiation of air due to impurities added to it by respiration is a subject of great moment. Following are figures showing the difference in the proportion of the constituents of the percentages of expired air and of ordinary air.

	Ordinary air	Expired air
Oxygen	20.96	16.40
Nitrogen	79.00	79.19
Carbon dioxide	0.04	4.41

From these figures it is seen that expired air contains over 100 times more carbon dioxide and nearly 5 per cent less oxygen than ordinary atmospheric air. Experiments have shown that the average adult emits with each expiration 22 cubic inches of air, or, assuming 18 respirations a minute, 570,240 cubic inches, or 330 cubic feet, of air in 24 hours. In this total of expired air there are 14.52 cubic feet of carbon dioxide. This amount is increased with increase of physical activity. The figures of De Chaumont, which are generally accepted, show that there is 0.6 part of carbon dioxide per 1000 in the air of a closed and occupied space, or 0.2 part in excess of that in ordinary atmosphere. Burning of coal or illuminating gas adds to the impurity, and hence ventilation is essential. In public buildings, such as those named, there should be 3 cubic feet of space per person in each room, after deducting from the total room space the amount occupied by furniture and the bodies of the persons. (8) *Prevention of Disease*. This is a very large topic, and necessarily bears close relation with personal as well as domestic hygiene. It includes notification of diseases to a health officer, most of the activities of municipal departments of health (see HEALTH, BOARDS OF, SCHOOLS, MEDICAL INSPECTION OF), control of streets and houses and disposal of refuse (see DISINFECTANTS), control of disease entering seaports (see QUARANTINE); prophylaxis of special kinds against spread of disease (see ANTITOXIN, SERUM THERAPY, VACCINATION), cleansing of public vehicles, to which reference has been

made, etc. Overcrowded and dark tenements are the most frequent causes of the spread of disease in a community. They keep alive the diseases of childhood—measles, scarlet fever, diphtheria, etc.—and are the most frequent hiding places for the germs of tuberculosis. (9) *Disposal of the Dead* is regulated by sanitary laws, which provide, in cities, that undertakers shall obtain permits for removal of dead bodies, and proper disposition shall be made of them by burial or cremation. Public funerals in the case of contagious diseases are often forbidden, and hermetically sealed caskets are enjoined in such cases by many municipalities.

Mental and Physical Hygiene. To regard the matter from another view point, hygiene may be also divided into mental and physical. The former will necessarily include many questions that belong to the latter, for the healthy action of the mind depends to a great extent upon the health of the body. A sufficient amount of sleep ought to be taken to refresh the powers of the mind as well as those of the body, and that sleep ought not to be much disturbed by dreams. Of course there are those whose occupation demands varied, sometimes excessive, exertion, and who must be "a law unto themselves." The great time for practically applying the laws of mental hygiene is during the years of childhood and youth. The method of teaching the child should be of the simplest as well as of the most comprehensive character, and the periods should be frequent during which its mind is completely relieved of all serious study and allowed to come to a perfectly natural and passive condition by mirthful and affectionate enjoyment. The school-rooms should be commodious and well ventilated, and they should not be overcrowded. Too many studies should not be required, so that hours which should be given to recreation or sleep will not be occupied with laborious efforts of study, which often do little more than produce a disturbed and unrefreshing sleep and pervert or destroy the appetite for wholesome food. In the matter of school hygiene great importance is attached to the amount, arrangement, and distribution of light in the classrooms, the construction of the seats and desks, the type and paper used in making the textbooks, etc. Carelessness in these matters is known to be one of the most fruitful sources of imperfect sight, such as myopia, as well as of various deformities, especially spinal curvature. See SCHOOLS, MEDICAL INSPECTION OF.

Military Hygiene is a system of principles for the preservation and promotion of the health of the soldier. The application of these principles is called military sanitation, which has for its object the prevention of disease. As almost all of the activities designed to preserve the health of the soldier are directed towards the prevention of disease, the term most applicable to the system is "military sanitation." In other armies than the American the administration to which is confided the preservation of health by the prevention of disease and the treatment of sick and wounded is called the "sanitary service", in the United States medical officers and hospital corps soldiers, in the organization of the army, are designated as "sanitary troops."

The direct relation which is so well known to exist between the health of an army and its efficiency as a fighting organization gives vast importance to this subject. The increase of knowl-

edge of the cause of disease has led to the many recent applications in preventive methods. When it is considered that healthy men of military age are subject only to preventable diseases which come from without, it can be readily appreciated that the efforts for military efficiency must be directed continually against the enemy within the ranks, which is far more dangerous and destructive than the enemy without. The study of medicosanitary statistics, of all armies, reveals the overwhelming part the so-called preventable diseases have played in rendering an army noneffective. In the three years' campaign of the British army in South Africa, one-sixth of all the admissions to hospital for disease were due to typhoid fever and dysentery, and these two diseases caused two-thirds of all the deaths from disease and one-half the total losses by death from all causes during the war.

Armies in extended and inactive campaigns rest their fate on sanitary conditions, and more deaths result from disease than from wounds. In short and decisive campaigns the deaths from wounds are greater. In the Mexican War (1846-47) there were 6 deaths from disease to 1 from wounds, in the Crimean War (1854-56) the French ratio of loss was 10 from disease to 1 from wounds, in the American Civil War (1861-65) the ratio was 2 to 1, in the German army (1870-71) it was 12 from disease to 1 from wounds, in the Sino-Japanese War the Japanese ratio was 12 to 1, and in the Spanish-American War the American losses were 12.5 to 1. In the Russo-Japanese War, for the first time in history, the loss from disease was less than from wounds, viz., 1 to 2. It is evident that the efficiency of the sanitary department cannot be determined directly from the ratios of deaths from wounds without a study of the conditions of campaign.

In no other art in late years has there been greater progress than in military sanitation. It has, by its discoveries, inventions, and practices, demonstrated to the civilized world methods for the prevention of disease which could have been developed only under a system of military organization and discipline. The two most important sanitary innovations have followed the demonstration, by Reed of the American army, that yellow fever was transmitted by a mosquito's bite, and the preparation of a vaccine, by Wright of the British army, that protects against typhoid fever. By the first discovery yellow fever was driven out of Cuba and the Isthmus of Panama, and it can be totally suppressed wherever proper sanitary methods can be effectually enforced. Surgeon-General Gorgas, of the American army, made the Panama Canal possible by his military sanitary measures, directed largely towards the extermination of mosquitoes by the destruction of their breeding places and towards the protection of the person against the bites of mosquitoes. General Gorgas says, "The disappearance of malaria from Havana was due solely to mosquito work."

The efficiency of the typhoid vaccination of Wright was first demonstrated in the English army, and since 1911 it has been employed in the American army, where typhoid fever practically no longer exists. This disease was pronounced by Kean in 1905 to be "the most formidable infectious disease with which we have to contend in military life." The incidence of typhoid fever is never an alarming factor in a garrison, but it has been known as a scourge in

camp. After the compulsory vaccination against typhoid fever, in 1911, of every soldier in the United States army, 20,000 men were in camp along the Mexican border with only two cases of typhoid fever infecting satisfactorily vaccinated soldiers. In four large camps in the United States, with a total strength of 55,829 soldiers, during the Spanish-American War, there were 7745 cases of typhoid fever. In the 250,000 volunteer troops assembled shortly after the declaration of war there were 20,000 cases, or 80 cases to each 1000 troops.

Malaria has been brought under control by military sanitation through the discovery, by the French military surgeon Laveran, of the blood parasite which causes the disease, and the demonstration, by Ross of the Indian army, of the manner of transmission by the passage of the parasite from the proboscis of a mosquito of the *Anopheles* species to the patient by the "bite" of the mosquito, and the subsequent introduction of measures to destroy breeding places of mosquitoes. Not a single death from malaria occurred in the United States army between 1906 and 1914, in 1907 there were three cases per thousand admitted to hospital in September, while in 1885 the rate was 31 per thousand.

The two types of dysentery which cause much sickness of the soldier in the tropics are caused, one by an animal parasite (an amœba) and the other by a vegetable organism (a bacillus). Vedder of the American army, in 1912, discovered the specific effect of emetine (a derivative of ipecac) on the amœbic form of dysentery, which cures the disease when administered hypodermatically.

Typhus fever, while it disappeared largely from the armies of the West through their general sanitary progress, remained a great scourge in the armies of the East until the mystery of its transmission was recently solved. It is now no longer feared, because it is known to be transmitted by the bite of the body louse, and means of prevention can be easily adopted.

Cholera is another disease which always threatens armies in the near and far East, but in America and Europe it is of little concern in time of peace, and in time of war it could only arise as a formidable epidemic during a campaign of great privation. It is a disease of Asia and tropical countries, where people live in close quarters and unsanitary surroundings which permit the ready passing of the germ from one to another by personal contact, excreta, food, clothing, and utensils, as the germ must pass into the alimentary tract to cause the disease. The heavy mortality which has given it its name such terror is due to the disorder, privation, or poverty under which it always arises. Water is not a very important means of transmission. The death rate in cholera is 50 per cent and in typhoid fever 10 per cent, but with the same sanitary surroundings and treatment it is almost certain that cholera would become a disease no more fatal than typhoid fever. Cholera frequently occurs in epidemic form adjacent to military posts without infection of the troops, because they are wholly protected by sanitary measures.

In the American army, in 1911, the highest admission rate of all diseases, expressed in numbers for each 1000 men, was, for venereal disease, 163.85, followed next by tonsillitis, 57.14. The highest death rate was, for tuberculosis, 0.52, followed by measles, 0.45. The most frequent

cause for discharge was tuberculosis 2 85, followed by insanity, 1 37. The highest noneffective rate was charged to venereal disease, 3 82, followed by tuberculosis, 1 63.

Another of the great sanitary advances has been made in the control of venereal disease, which has been preeminent in the American and English armies, as compared with others. In 1912 venereal personal prophylaxis was imposed by order upon the American army, and since that time the rate of admission for American troops in the United States proper has been reduced from 163 85 in 1911, to 87 02 for the first six months in 1914, per thousand, but the real reduction has been, perhaps, twice as much as indicated by these figures, because, since compulsory methods of detecting the disease have been enforced by means of regular physical examinations and education, it is probable that twice as many cases have been admitted to record as before. In a command of 1000 men in the United States army the loss of days in one year from this disease would be 1652 before the enforcement of the order and 542 after, or a gain of 1110 days' service in one year. The application of the Wassermann blood test, by which syphilis, in either active or inactive states, can be accurately determined, and the invention of Salvarsan as a specific agent in treatment, has led to renewed energy and efficiency in the treatment of syphilis in the army and with more favorable results, because of the military control, than can be attained in civil life.

The three cardinal principles upon which military sanitation is conducted are (1) The protection of the soldier against himself as the chief transmitter of the diseases from which he suffers (2) The purification of water and the protection of food (3) The destruction of all disease-transmitting animals which attack him from without, such as mites, which cause scabies and "the seven-year itch", ticks carrying Texas fever and Rocky Mountain spotted fever, bedbugs, conveying relapsing fever, typhoid fever and probably kala-azar and leprosy, lice, transmitting typhus fever and recurrent fever, fleas, carrying bubonic plague, cockroaches, conveying all sorts of germs which infect food and milk, and also the germ of tuberculosis, diphtheria, typhoid fever, and tonsillitis, mosquitoes and flies, which, of all the animal transmitters of disease next to mosquitoes, must be considered the most dangerous. After the tsetse fly, which carries the African sleeping sickness, we find the greatest pest and health menace in the common house fly (q v).

The water supply of an army is one of the deepest concerns of the sanitary department, and it involves a care ranging from driving wells to secure a water supply to its purification by heat, filtration, chemical treatment, or the ultra-violet mercury lamp. Many satisfactory processes of water treatment require apparatus of such weight and complication that it is impracticable to carry the apparatus with an army in the field. Heat requires fuel and vessels which are not always at hand. Filtration and violet light require apparatus, but the recent application of a chemical method which uses chlorine has been made in the American army and marks another great advance in military sanitation.

Darnall introduces a pure, dry, liquid chlorine gas, contained under pressure in a steel drum, into a reservoir or pipe of running water. The chlorine's rapid affinity for hydrogen takes

the hydrogen atom from the oxygen atom in the water molecule and leaves the nascent oxygen to destroy quickly and positively all pathogenic organisms. This method, however, is not applicable to the needs of troops in the field on account of the somewhat complicated and heavy apparatus.

Lyster has made the most practicable application of the chlorine agency by using the chlorine-bearing powder, chlorinated lime, which, when added to water in the proportion of 1 to 500,000, effects sterilization in a few minutes. The great advantage of this method is the very little weight of required apparatus, which consists of a bag made of canvas, 38 gallons' capacity and 5 pounds in weight, with six stop-cocks around the bottom for drawing off the water. Sealed glass tubes of chlorinated lime, 15 grains each, containing 30 per cent available chlorine, are carried with the water bag. The simple mixing of the contents of one tube with the water filling the bag sterilizes enough water to fill the canteens of one company of infantry, at war strength, numbering 157 men. The Lyster water bag, adopted by the United States army in 1914, requires no special transportation facilities, as it is carried on the back of the company trumpeter, who, being without a rifle, still carries less than the equipment load of the armed soldier.

The close contact of soldiers living in barracks and camp, under conditions designed to reduce domestic system to minimum limits, favors the transmission of disease, through contact of person, clothing, bedding, and equipment, and the use of common utensils. The sanitary measures directed against this disposition of the soldier to spread his own diseases are based upon the disposal of excreta, protecting of food, and personal hygiene.

The purity, quality, and quantity of the soldier's ration, which contributes so directly to his efficiency, are maintained by the constant vigilance of sanitary examinations and inspections. The American soldier's ration is especially adapted to his needs by the variety and sufficient quantity of its components, which are more liberal than that of any other soldier. The normal fuel value is 3536 calories, which can be ranged from 2500 to 5674 calories by varying the components. Fresh meat, and usually beef of best quality, is issued 7 days in 10.

Military sanitation is inseparable from military discipline. The widely heralded success of Japanese sanitation in Manchuria was not due to any new hygienic discoveries, but only and solely to the severe discipline with which the principles taught by the armies of the Western world were applied. The notoriously strict discipline in the German army, carried out also in its sanitary administration, has reduced its sickness and death rate to the lowest of all armies in the world, and this result has contributed no small part to the incomparable economic advance which the German Empire has made from the time of her War of 1870 to her War of 1914.

The topics included in military hygiene and sanitation are (1) *Sanitary Organization* (2) *Physical Condition and Selection of the Recruit* his physical training, general development and moral education (3) *Marching* care of feet, halts, forced marches, adjustment of equipment and clothing, weather conditions, and general physiological applications. (4) *The Ration* composition, value, and preparation, garrison,

travel (cooked), and emergency rations. (5) *Clothing, Uniform, and Equipment* material, quality, nonactinic property, distribution of weight, garrison and field clothing (6) *Water Supply* examination, protection, and purification (7) *Posts, Barracks, Quarters, and Hospitals* construction, ventilation, heating, and lighting, disposal of wastes (8) *Camp Sites and Camps* temporary and permanent, soil, vegetation, area, tents, varieties of shelter, portable buildings, disposal of wastes and excreta, bathing and washing, prevention of flies, protection against mosquitoes, sanitary rules (9) *Personal Hygiene of the Soldier* daily toilet, bathing, care of bowels, change of clothing, habits, and morality (10) *Prevention of Infectious Disease*, venereal prophylaxis, vaccination against typhoid fever and smallpox (11) *Service in Tropical Countries* characteristics of climate, effects on body and mind; food, beverages, solar rays, actinic rays, sunstroke, clothing, shelter, tropical-disease prevention (12) *Service in Cold Climates* (13) *Disinfection* methods and materials (14) *Sanitation of Troop Ships* (15) *Sanitation of the Battlefield* (16) *Quarantine* Many of the above topics in special or other connections find discussion elsewhere in the *ENCYCLOPEDIA*, and to such articles the reader is referred.

HYGIENE OF FOOD See *FOOD*

HYGINUS, GAIUS JULIUS A Latin author. He is generally supposed to have been a native of Spain, though some writers assert that he was born in Alexandria, Egypt, and that he came to Rome with Julius Caesar when a mere child. He is known to have been a favorite with Augustus, who made him chief librarian in the new Palatine Library. He was a voluminous writer on many subjects, including biography, agriculture, bee keeping, and military arts, as well as comments on the poems of Vergil and Cinna. These have all been lost. There are also two works still in existence that are assigned to him—one, a textbook on mythology, entitled *Fabularum Liber*, consisting of 277 mythological legends, valuable chiefly because of the use made of Greek tragedies, in many cases now lost, the other, an astronomical treatise entitled *Poeticon Astronomicum Libri IV*, an elementary treatise on astronomy, including the myths connected with the stars, of little value now. This astronomical treatise is based mainly on the *Kataastrologia* of Eratosthenes (q.v.) On stylistic grounds it is held that these extant works, clearly the work of one man, cannot have been written by the Hyginus of the Augustan age, the Latin is defective, and there are serious errors in translation from the Greek. They may be an abridgment, however, of works by Hyginus. The *Fa-*

bulae were edited by Schmidt (Jena, 1872) and the *Astronomica* by Bunte (Leipzig, 1875). Another Hyginus, known as *Gromaticus*, lived probably in the second century and wrote a work on surveying, edited by Gemoll (ib, 1879). Consult Teuffel, *Geschichte der römischen Literatur*, vol 11, § 262 (8th ed, ib, 1910), and Schanz, *Geschichte der römischen Literatur*, §§ 342-350 (3d ed, Munich, 1911).

HYGINUS, SAINT Pope, or Bishop of Rome, about the middle of the second century, possibly 137-141. Very little is known about him.

HYGINUS GROMATICUS See **HYGINUS**

HYGROMETER (from Gk *ὕψος*, *hygros*, moist + *μέτρον*, *metron*, measure) An instrument for measuring the quantity of moisture in the atmosphere. In addition to the gases of which it is composed, the air contains the vapor of water, which is invisible except when it is condensed in the form of fog or cloud. The amount of this aqueous vapor varies greatly and depends chiefly on the temperature, being at a minimum on cold days and on warm days forming as much as one-fiftieth part of the air. This vapor exerts a certain pressure depending upon the quantity present and the temperature, and when the latter is sufficiently reduced condensation takes place and fog or dew is formed. When the moisture present in a given case is the maximum possible, the temperature is called the temperature of saturation, and if the temperature is reduced below this point condensation takes place. The temperature at which condensation occurs is known as the dew-point temperature (See *DEW*). The less moisture the air contains the lower will be the dew point, and when this is ascertained experimentally, we can use it to determine the pressure of the vapor at that temperature, as the pressure of water vapor and its relation to temperature has formed the subject of extensive and elaborate experimental researches that are now embodied in carefully prepared tables. It is known that the quantity of water contained in the air varies directly (or nearly) as the vapor pressure, consequently a ratio between the vapor pressures at an observed temperature and the saturation pressure for the atmospheric condition at the time of observation gives the relative humidity. The amount of moisture in the atmosphere is often expressed in terms of relative humidity in the daily meteorological observations, and the chief function of the hygrometer is to afford such data as will enable us to determine this quantity.

Hygrometers can be divided into several classes. There are those in which use is made of the property of certain substances of altering their dimensions or weight upon absorbing moisture from the air. Of this class the most reliable are those in which a hair expands and contracts according as the air is more or less moist, and moves a pointer or index over a scale, and indicates relative humidity direct. This form was invented by Saussure, the Swiss physicist, and a somewhat similar instrument was devised by Deluc in which a strip of whalebone was employed. The instruments are known as hygrometers and are used where other forms of apparatus cannot be employed. Their indications, however, are not highly exact. Another class of hygrometers is based on the principle that certain chemicals will absorb moisture, and the amount thus abstracted from a given volume

of air will give the quantity present in the atmosphere. The apparatus consists of a series of drying tubes containing some hygroscopic material, as substances which readily absorb moisture are termed, through which air is drawn by means of an aspirator or other device. The substances which may be used for this purpose are strong sulphuric acid in pumice stone, calcium chloride, phosphoric acid, and potassium or sodium oxide. The amount of moisture is determined by the increase in weight. The class of hygrometer very generally employed for accurate work includes apparatus where the temperature is reduced until condensation takes place, or this temperature can be determined from the temperature of evaporation. Knowing the dew point for a given condition of the atmosphere, the other data can be readily ascertained.

The Daniell hygrometer, which figures extensively in the earlier works on physics and meteorology, consists of two bulbs connected by a bent tube, as represented in the figure, and inclosing a thermometer together with some ether

DANIELL HYGROMETER.

and vapor of ether, the air having been expelled before the tube was sealed. One bulb is either blackened or coated with metal, while the other is covered with muslin. The observer's hand is placed for a short time on the muslin-covered bulb to drive the ether into the opposite bulb, leaving the first bulb and the tube filled with the vapor of ether. A little ether is then dropped from the bottle on the muslin-covered bulb; evaporation instantly takes place, and the temperature is reduced, thus condensing the vapor inside; a fresh evaporation from the other bulb fills the vacuum, and the vapor is again condensed by dropping more ether on the muslin covering, the process being repeated until the temperature of the bulb containing the thermometer is so reduced by successive evaporations (see EVAPORATION) that dew begins to be formed on the outside of the bulb. At the instant this occurs the height of the mercury in the two thermometers is accurately noted—the one giving the dew-point temperature, and the other the temperature of the air. There are other forms of dew-point apparatus, all depending upon this same principle, and the hygrometer of Regnault was devised to remedy some of the defects of the Daniell apparatus. In this instrument a current of air is used to increase the evaporation of the ether, and instead of a glass tube and bulb there is a brightly polished thimble of silver at the base of one of the thermometers, which contains the ether. The air bubbles through the liquid, and the rate of evaporation becomes much more rapid. Knowing the dew point, a reference to the table will furnish the pressure of aqueous vapor at that temperature, and other tables or the application of a formula will give the amount of moisture in a given quantity of air.

Instead of the dew-point apparatus, the wet and dry bulb thermometers, or psychrometer, is now generally employed in making ordinary observations, especially by meteorologists. The instrument consists of two ordinary thermometers—one has its bulb bare, and thus shows the temperature of the air, while the other has its bulb covered with muslin which is kept wet with water. The thermometers are often so united that they can be rapidly revolved in order that the wet bulb may be exposed to a constant current of air. In the illustration is shown the sling psychrometer issued by the United States Weather Bureau, where the thermometers are mounted in such a manner that they can be whirled about the hand of the observer. The evaporation from the muslin and the consequent cooling of the bulb being proportional to the dryness of the air, the difference between the readings of the two thermometers is greatest when the air is driest, and zero when it is completely saturated. The readings of the psychrometer and the dew-point apparatus at the same time have been carefully compared, and it has been ascertained that the vapor pressure at the dew point of air is equal to the vapor pressure corresponding to the temperature of the wet-bulb thermometer minus the number 0.011, multiplied by the difference in degrees between the dry and wet bulb thermometers. This rule is stated as applying when the psychrometer is whirled, and when the pressure of the barometer is equal to 30 inches. From the difference in readings between the thermometers the vapor pressure can be calculated by formulas which, with certain modifications, are based on those used by Regnault.

U. S. WEATHER BUREAU SLING PSYCHROMETER.

Ferrel's formula, used by the United States Weather Bureau in calculating its tables, is as follows:

Let p = vapor pressure of saturation at dew-point temperature.
 p' = vapor pressure of saturation at wet-bulb temperature.
 P = barometric pressure.
 t = reading of dry thermometer.
 t' = reading of wet thermometer.

$$p = p' - .000367 P (t - t') \left(1 + \frac{t - t'}{1571} \right).$$

In practice it is customary merely to take the difference between the wet and dry bulb thermometers and refer at once to the tables, which will give the relative humidity, the amount of moisture in a given quantity of air, and other desired data. These tables and full directions for practical hygrometry are contained in the publications of the United States Weather Bureau, to which the reader is referred for further information, while nearly all the larger treatises on physics contain satisfactory treatment of the subject. Consult Preston, *Theory of Heat* (London, 1904), and M. T. Edelmann, "Neues Absorptions-Hygrometer," in *K. Bayerischen Aka-*

denise der Wissenschaften, Sitzungsbericht, vol xxxvii (Munich, 1907) See HUMIDITY

HY'GROPHYTES (from Gk *ὕγρος*, *hygros*, moist + *φυτόν*, *phyton*, plant) Plants which grow naturally in regions where the atmosphere is moist. Hygrophytes differ from hydrophytes in that they are not necessarily associated with water in the liquid state. Hygrophytic leaves show a number of peculiarities in contrast with xerophytic leaves. For example, hygrophytic leaves do not suffer, but rather thrive, in very moist atmospheric conditions. The leaves themselves are also easily moistened. This type of leaf is very characteristic of the tropical rainy forests, but also is often found in deep narrow cañons and heavily forested ravines. Xerophytic leaves, in contrast with hygrophytic leaves, are not readily moistened and commonly die if subjected to a moist atmosphere. See HYDROPHYTES

HY'GROSCOPE See HYGROMETER

HYKSOS, hik'sōz The name of a dynasty of Egyptian kings, who are known also as the Shepherd kings. Manetho, of whose annals an excerpt is preserved in Josephus, narrates that foreign conquerors from Asia, who were called Hykussos, took possession of Egypt. This name, according to Breasted (*A History of the Ancient Egyptians*, p. 178), in all probability is composed of the word "Hyk" (or ruler) and the word meaning 'countries'. The latter by slight and very common phonetic changes might become "sos." The explanation, based on the mutilated form Hyksos and the interpretation sos as Egyptian *shōs* (shepherd), although attributed to Manetho, seems to have originated at a later time. Consequently we have in this no basis for determining the nationality of those foreigners, "of unknown race," as Manetho says. Usually historians, following this later etymology and the insertion in Manetho ("they are said to have been Phœnicians or Arabs"), consider them as nomadic Semites, either Arabs or Canaanites, recently settled in Palestine. Others have supposed them to be Tuamians, thinking that they found Mongolian features on statues which were for a long time attributed to the Hyk(us)sos, but are now generally recognized as belonging to an earlier period. Nothing positive can be said as to the origin of this people, it is only known that the conquerors had first founded an empire in Syria (coming from the north from Asia Minor?) before conquering Egypt. This explains why many Semites came thither along with them and, later, under their rule. The date of their conquest is doubtful. From the confused extracts from Manetho, they would seem to have formed the fifteenth and sixteenth dynasties, lasting 259 and 251 years respectively, and would thus have begun about 2100 B.C. But the sixteenth dynasty seems to be an erroneous repetition, so that only the fifteenth dynasty with six (?) kings remains, and for these 250 years are certainly too much. Taking into consideration the recently discovered Sothiac date for the twelfth dynasty, not much more than a century would remain for them, and therefore the invasion of the foreigners ought to be placed at about 1657 B.C. (Breasted). The reports of the cruelties and devastations which, according to Egyptian tradition, accompanied the conquest are untrustworthy. In one point, however, the traditional account has been confirmed: the invaders built a strong fortress on the north-eastern frontier of the Delta, in the Sethoite nome, called Avaris (Egyptian, *Hatwaret*), and

placed in it a strong garrison to secure the connection between the Syrian and Egyptian provinces. The conquerors soon adapted themselves to Egyptian manners, leaving probably the old administration untouched, and the kings assumed Egyptian names. Three or four of these royal names have been found on the monuments. Contemporary monuments give the names of three Apophises and Khian, besides possibly Khenger and Jacob-hei (Breasted, op. cit. p. 182). An alabaster vase cover bearing the cartouche of King Khian was found at Onosus in Crete (*Year Book*, 1901, p. 45, cf. *Annual of the British School in Athens*, vii, p. 65). The second Apophis reigned for at least 33 years, as the mathematical papyrus of London written in his reign attests. These kings resided in Memphis, Avaris, and Heliopolis (?), having the Delta under their direct administration and leaving the country above Memphis to tributary princes of the old nobility. This proved fatal to their dominion, for the vassal Prince of Thebes soon felt strong enough to rebel against his sovereign. A popular tale (Papyrus Salher I) gives a fanciful narrative of the beginning of this war in stating that Apophis complained to King Sekeneure in Thebes that the noise of the hippopotami disturbed his slumbers in Avaris, but the mutilated condition of the manuscript renders it difficult to decide whether the foolish arrogance of Apophis or his exaggerated zeal for his god Set is represented as the cause of the struggle. The popular idea that the Hyk(us)sos brought along their own native god of war, Sutekh, and tried to force his exclusive worship upon the Egyptians, is incorrect, this god was merely the Egyptian divinity Set, an "Egyptianized form of some Syrian Baal" (playfully written Sutekh), the local god of the capital, Avaris, who became, of course, the official patron of the kings, but did not dispossess any other cults. The revolt against Apophis (II?) was started by Sekeneure, the Prince of Thebes (which of the three princes of that name is doubtful), and lasted for long years, extending through the reigns of two short-lived Theban princes (Kames and Snekten-rē).

The princes of the nomes north of Thebes were annihilated in the war of independence, as they do not seem to have joined the national cause. When Amasis I (Ahmose, c. 1580 B.C.) ascended the throne, the Pharaohs of the foreign dynasty seem to have been almost completely expelled, but they sustained a long siege in their last stronghold, Avaris. This city fell in the third or fourth year of Amasis Ahmose, and the surviving inhabitants were distributed as slaves. The strange statement in Manetho that Mischragmuthosis (i.e., Thothmes III, c. 1500 B.C.) took Avaris and allowed the remainder of the Hyk(us)sos to retire to Syria, is, of course, erroneous. No remarkable buildings of the Hyk(us)sos kings have survived, only traces of temple restorations in Bubastis and the modern Gebelen. Possibly their constructions were destroyed after the expulsion. A considerable part of Syria seems to have been tributary to them, but the small stone lion bearing the name of Apopi (I?), found at Bagdad on the Tigris, cannot be considered to prove that these monarchs ruled as far as Babylonia. The whole of this interesting portion of Egyptian history is very obscure. Consult Koch, *De Regibus Pastoribus* (Maburg, 1844), Chabas, *Les pasteurs en Egypte* (Amsterdam, 1868), W. M. Muller,

in *Mitteilungen der vorderasiatischen Gesellschaft* (Berlin, 1898), W M F Petrie, *Hyksos and Israelite Cities* (London, 1906), Bristead, *A History of the Ancient Egyptians*, pp 173-189 (New York, 1908)

HY'LA (Neo-Lat, from Gk ὕλη, *hylē*, wood) The typical genus of the tree-frog family, *Hylidæ*, hence the word is often used as a name for tree frogs in general, especially the common variable one (*Hyla versicolor*) of North America. See TREE FROG

HYLÆ'US (Lat, from Gk Ὑλαῖος, *Hylaios*, woodman) In Greek mythology, an Aicadian centaur who pursued Atalanta (see ATALANTA, 2) and was slain by her. In other legends he falls in the fight against the Lapithæ or is slain by Hercules

HYLAS, hyl'as (Lat, from Gk Ὑλας) In Greek legend, son of Theodamas or Theiomenes, favorite of Hercules, who took him on the Argonautic expedition. In Mysia, near the mouth of the Gios, while drawing water from a spring, he was made captive by the nymph of the place. Hercules returned in sorrow to Greece, taking with him hostages of the Mysians and requiring that they should continue the search for his beloved. The story was developed by the later Greek writers and seems to have arisen from a Mysian religious festival, where a priest thence called the name of Hylas. Consult Mannhardt, *Mythologische Forschungen* (Strassburg, 1884), Von Muller, *Handbuch der klassischen Altertums-Wissenschaft*, vol v, 2 (Munich, 1906), Fairbanks, *The Mythology of Greece and Rome*, pp 193, 354 (New York, 1907).

HYLLESTED, hyl'le-stéd, AUGUST (1858-) A Swedish pianist and composer, born of Danish parents at Stockholm, Sweden. He showed great musical precocity, playing in public when only five years old. He studied under Holger Dahl in Copenhagen, until 1869, and then, after making a concert tour in Scandinavia, entered the Royal Conservatory of Copenhagen. In 1876 he was appointed organist of the cathedral there and director of the Nykjøbing Falster, a musical society. Three years later he studied with Kullak and Kiel in Berlin, leaving there to become a pupil of Liszt. He made many notable concert tours in Europe and America and was the recipient of numerous honors. He was assistant director of the Chicago Music College (1886-91) and director of the piano department in the Gottschalk Lyric School (1891-94). In the latter year he went to Europe for an extended concert tour and upon his return, in 1897, settled in Chicago. His compositions, the most popular of which are his songs and piano pieces, include the symphonic poem, *Elizabeth*, for full orchestra and double chorus, *Suite romantique*, *Marche triomphale*, etc.

HYLLUS (Lat, from Gk Ὑλλος) The son of Hercules (qv) and Deianira (qv), married at his father's command to Iole. When Eurystheus was repulsed by the Heraclidæ (qv) with the aid of the Athenians, Hyllus slew him as he fled. Adopted by the Dorian Ægimius in Thessaly, Hyllus gained the leadership of the Dorians (qv) for himself and his descendants. Having invaded the Peloponnesus in obedience to a command of the Delphic oracle to seize the Kingdom of Eurystheus "after the third fruit" he was unsuccessful and was killed in combat by King Echemus of Tegea. The oracle was fulfilled in the persons of his great-grandsons Temenus,

Cresphontes, and Aristodemus, who after the third generation conquered the Peloponnesus. See HERACLIDÆ

HY'LOBATIDÆ (Neo-Lat, from Gk ὕλοβάτης, *hylobatēs*, one that walks the woods, from ὕλη, *hylē*, wood + βαίνειν, *baínein*, to go) A family of Primates comprising the gibbons (see GIBBON). This name, meaning tree walkers, is well bestowed, for their entire lives are passed upon trees, though whose branches they move with the ease of a creature of flight. On the ground they are almost helpless, running with quick, unsteady steps, and holding both arms over their heads to balance themselves. Elliot admits two genera, *Hylobates*, with 12 species, and *Symphalangus*, with one species. They are the lowest, most generalized of the anthropoid apes.

HYLO'DES A genus of cystignathine frogs, of which over 50 species are known in tropical America, all small and like tree frogs, with the fingers free and provided with undivided disks. A typical and familiar species of the West Indies (*Hylodes martinicensis*) has some remarkable traits, described under COQUI.

HY'LOGLYPHS See EASTER ISLAND

HY'LOPHYTES (from Gk ὕλη, *hylē*, forest, matter + φυτόν, *phytón*, plant) Plants which grow in the woods, forest plants. The hylophytes are contrasted with the poophytes, i.e., the plants of grasslands.

HY'LOZO'ISM (from Gk ὕλη, *hylē*, matter, wood + ζῶν, *zōn*, animal). The assumption that the principle of all change is to be found in material substance, and that all matter is instinct with life. The term is applied to the Ionic school (see GREEK PHILOSOPHY), which sought the explanation of the universe in terms of water, air, fire, etc., and thus assumed, without further investigation, that matter in one form or another had in it "the promise and potency" of all change, including vital processes.

HYMANS, é'man', SALOMON LOUIS (1829-84) A Belgian historian, poet, and publicist, born at Rotterdam, known simply as Louis Hymans. He was editor of various papers and director of the *Écho du Parlement*, a Liberal journal. He was elected a member of the Belgian Chamber of Representatives for the city of Brussels (1859), held that post for 11 years, and showed himself an upright and conscientious politician. He was the author of several novels, of *Lettres moscovites* (1857), *Histoire parlementaire de la Belgique* (18th ed, 1880), *Histoire populaire du règne de Léopold I* (1864), *Histoire politique et parlementaire de la Belgique* (1869-70), *Notes et souvenirs* (1876), *Types et silhouettes* (1877), reminiscences, *Bruelles à travers les âges* (1883-89).

HY'MEN, or HY'MENÆ'US (Lat, from Gk Ὑμῆν) Originally the Greek name of the marriage song, later the Greek god of marriage, of whom many varying legends were told. The myths usually represent him as son of Apollo and a Muse, more rarely of Dionysus and Aphrodite. In art he is usually represented as a youth of delicate, almost feminine beauty, with a crown of flowers, a bridal veil, and a bridal torch, more rarely with wings. As the marriage procession waited before the house of the bride, and later, as it conducted her from the house of her father to that of her new-made husband, Hymen was invoked. Consult Schmidt, *De Hymenæo et Talasio* (Kiel, 1886), Usener, *Gotternamen* (Bonn, 1896), Darem-

berg and Saglio, *Dictionnaire des antiquités* (Paris, 1873-1914), Catullus, lxi-lxii, with comments of the editors

HYMENIUM In plants, a layer of spore-producing cells. The term is used chiefly among the Ascomycetes (qv) and Basidiomycetes (qv) to designate a layer of asci in the one case and a layer of basidia in the other. For example, the scarlet lining of the scarlet-cup fungus is a hymenium (sometimes called hymenial layer) composed of asci, while in the common mushrooms the gills are covered by a hymenial layer composed of basidia.

HYMENOCEPHALUS (Neo-Lat., from Gk *ὑμήν*, *hymēn*, membrane + *κεφαλή*, *kephalē*, head). A genus of small pelagic fishes of the tropics, of the family Macruridae (see GRENADE), noted for the papery nature of the bones of the cranium. The only known species (*Hymenocephalus cavernaeus*) is gray, with silvery tints on the sides, and was taken from deep water in the Gulf of Mexico. See Plate of CODFISH AND ALLIES.

HYMENOMYCETES, *hi'men-ō-mī-sē'tēz*. A great division of Basidiomycetes (qv), distinguished by the fact that the hymenium (qv) is freely exposed, as in the ordinary mushrooms. The contrasting group is the Gasteromycetes, in which the hymenium is inclosed, as in the puffballs.

HYMENOPHYLLITES, *hi'men-ō-fil-lī'tēz*, AND **HYMENOPHYLLUM** (Neo-Lat. nom. pl., from Gk *ὑμήν*, *hymēn*, membrane + *φύλλον*, *phyllon*, leaf). A genus of ferns, usually called "filmy" ferns on account of their delicate leaves. *Hymenophyllum* and *Trichomanes* are the two genera which characterize the family Hymenophyllaceae, a family including approximately 250 known species and displayed chiefly in the tropics. One or two species of *Trichomanes* occur in temperate North America, but filmy ferns are an attractive feature of almost every large greenhouse. The sori (fruit dots) are borne in an unusual way among ferns. Instead of being distributed over the under surface of the leaf, they occur on the margin, at the ends of veinlets, each sorus being invested by a cup-like indusium. It was once supposed that the representatives of this family lived in very ancient times, but there is no satisfactory evidence of the existence of the family even as early as the Mesozoic. It is evidently one of the more modern fern families rather than the most ancient family, as was formerly supposed. See FERN.

HYMENOPTERA (Lat. nom. pl., from Gk *ὑμενόπτερος*, *hymenopterōs*, membrane-winged, from *ὑμήν*, *hymēn*, membrane + *πτερόν*, *pteron*, wing). An order of insects, containing the ants, bees, wasps, ichneumon flies, sawflies, gall-flies, and related insects, elsewhere described under their names. The order includes a very great number of species, estimated at about one-fourth of the whole class, of which some, as ants and bees, are singularly interesting and important. They have the mouth furnished with mandibles for cutting and tearing, but the other parts of the mouth are adapted for suction, and are generally narrow and elongated, often united into a kind of proboscis, as in bees. (See BEE.) The antennae are generally slender, but often exhibit differences in the sexes of the same species. The wings are four in number, the first pair larger than the second, the wings of the same side united in

flight by little hooks. When at rest, they are laid over one another horizontally over the body. The wings are entirely membranous, not reticulated as in the Neuroptera, but with comparatively few nervures, the arrangement of which is so constant in the whole order that particular names have been given to them and to the space between them, and their diversities have been made use of in classification. The wings are wanting in the imperfectly developed females ("neuters") of some. Besides the ordinary eyes, all the Hymenoptera have three small, simple eyes (ocelli), on the top of the head. The abdomen is generally united to the thorax by a slender pedicel. The abdomen of the females is generally furnished with an organ capable of being protruded, but for different purposes in different sections of the order, it being in some of the groups an ovipositor or borer, and in others a sting.

The Hymenoptera in their perfect state generally feed on honey, but some of them prey on other insects, which are the food of the larvæ of a greater number, while the larvæ of some feed on various vegetable substances. The metamorphoses of the insects of this order are perfect, the larvæ are generally—although not in all the families—destitute of feet, the pupæ take no food. The Hymenoptera are remarkable for the dilatation of the tracheæ, or air tubes, into vesicles and the general perfection of the respiratory system. The instincts and even apparent intelligence displayed by some of them—particularly the social kinds, which live in communities—have excited admiration from the earliest times. See INSECT, *Social Insects*.

Fossil Hymenoptera. These appear in the Mesozoic formations in small numbers. Only about a dozen species are known, mainly from the Jurassic limestones of Solenhofen, Bavaria. The oldest hymenopterans are ancestral to the modern ants. In the Tertiary deposits are found representatives of all the important families in fossil forms very close to the modern species. In America the best examples are found at Florissant in Colorado, and in Europe the freshwater shales of Aix, Emmingen, and Radoboj, and, best of all, the amber of the Baltic Provinces, are noted localities. Consult Scudder, "Systematic Review of our Present Knowledge of Insects," in *United States Geological Survey Bulletin*, No. 31 (Washington, 1886).

Classification. The order Hymenoptera is divided into two suborders, each containing several superfamilies, as follows:

Suborder *Heterophaga*—Superfamilies, Apoidea, true bees, Iphecioidea, solitary wasps, Proctotrypoidea, proctotrypoid parasites, Vespoidea, social wasps, Formicoidea, ants, Ichneumonoidea, ichneumon flies; Cynipoidea, gall-flies, Chalcidoidea, chalcids flies.

Suborder *Phytophaga*—Superfamilies, Siricoidea, horn-tails, Tenthredinoidea, sawflies.

Bibliography. Cresson, *Catalogue and Synopsis of the North American Hymenoptera* (Philadelphia, 1887), Ashmead, *The Habits of the Hymenoptera* (Cambridge, 1893), Dalla Torre, *Catalogus Hymenopterorum* (Leipzig, 1884), Sharp, *Cambridge Natural History*, vol. v (London, 1895), Ashmead, "Classification of the Entomophilous Wasps," in *The Canadian Entomologist* (London, Ontario, 1899), Ashmead, "On Synopses of Families of Hymenoptera," in *Journal of the New York Entomological Society* (New York, 1899).

HYMETTUS (Lat, from Gk Ὑμηττός) A mountain range in Attica, about 3400 feet high, now called Tielo-Vouni, between 4 and 5 miles east and southeast of Athens, famous to-day, as well as anciently, for its honey of excellent flavor. There was also quarried at Hymettus a bluish-gray marble, much prized in antiquity, though less highly than that of Pentelicon (qv).

HYMNOLOGY (Gk ὑμολογία, *hymnologia*, from ὑμολόγος, *hymnologos*, singing hymns, from ὕμνος, *hymnos*, hymn, connected with Skt *syūman*, bond, Lat *suave*, to sew, Gk *κασάειν*, *kassyein*, to make shoes, OChurch Slav *šiti*, to sew, Goth *suujan*, OHG *suujan*, AS *seouian*, Eng *sew* + Gk -λογία, *logia*, account, from λέγειν, *legein*, to say). The science of hymns, or the collective body of hymns used at a particular time or place. In the most general sense a hymn is a religious ode or poem, more specifically it is a metrical composition divided into stanzas or verses, intended to be used in worship. In some variety or form the hymn has been thus employed throughout the ages. The use of hymns grows out of the use of music in worship. Rhythm early began to be used both to produce and to express emotion. Wherever religion became emotional, it used rhythm in both dance and music. When the worship became in any degree formal, the rhythm expressed in poetry tended to become a part of a traditional ritual and produced the typical hymn. Two ancient collections of hymns of especial interest have come down—the Babylonian and the Vedic. The Babylonian were closely connected with incantations, but sometimes were appeals to the gods for aid in sickness or trouble—the so-called “penitential hymns” (Consult Jastrow, *Religious Belief in Babylonia and Assyria*, New York, 1911). The Vedic hymns were part of the ritual of sacrifice, primarily to designate the particular god for whom the sacrifice was intended (*Sacred Books of the East*, vols xxxii, xli). In Persia the Avesta had a collection of hymns, some of which, the Gathas, were ascribed to Zoroaster (*Sacred Books of the East*, vol xxxi). The religion of ancient Egypt produced hymns sung at the processions of worship (Consult Wiedemann, *Religion of the Ancient Egyptians*, New York, 1897). Confucius made a collection of poetry, the *Shih King*, 40 pieces of which are called “praise songs” or “songs of the temple and altar” (*Sacred Books of the East*, vol iii). Greece was the land of song, and there was heard a song on every occasion by every class to celebrate every event. The so-called Homeric hymns consist of poems of praise to the gods. Callinus, the father of elegy (c 700 B C), and Archilochus, a contemporary, wrote hymns, but none of them have reached us.

The Hebrew race produced the highest development of worship poetry before the Christian era, and it is a generally conceded fact that the Hebrew Psalter has never been equaled as a whole. The Psalter was the hymn book of the second temple, built after the exile. It consists of 150 Psalms, presenting a wide variety of religious experience and literary quality (See **PSALMS**). Habakkuk iii is also taken from a collection of hymns.

There is abundant evidence showing that the early Church made use of singing in its services of worship. Thus, Pliny in his letter to Trajan (103 A D) states “They [the Christians] had

been accustomed to come together on a fixed day before daylight and to sing responsively a song to Christ as God.” What songs were used in these early days is not definitely known. We have one hymn entire appended to *The Instructor* of Clement of Alexandria (c 200 A D). It is the earliest Christian hymn extant and may be Clement’s, though by some supposed to be earlier than his time. It is entitled *A Hymn to Christ the Saviour*. The best translation is by Dean Plumptre, but the most common one is by Henry M. Dexter, beginning “Shepherd of tender youth.”

Both the Eastern and the Western churches after their separation produced many hymns—some strongly dogmatic, but others purely devotional. Numbers of these have come down to us and either in translations or free adaptations have been used more or less constantly by various branches of the Church. Prominent among the hymn writers of the Eastern church were Gregory Nazianzen (died 390), Anatolius (died 458), author of the hymn translated “Fierce was the wild billow”, Romanus (died c 720), St Andrew of Crete (660-732), one of whose hymns is in common use in Dr Neale’s translation, “Christian, dost thou see them”, Cosmas (died 780), John of Damascus (died c 787), author of the hymn, “The day of resurrection” (Dr Neale’s translation), Stephen of St Sabas (died 794), author of “Art thou weary, art thou languid?” (Dr Neale’s translation), and the poets of the Stadium—Theodore (died 826), Joseph (died c 830), author of “Safe home, safe home in port” (Neale’s translation), and Theoctistus (died c 890), whose best-known hymn is translated “Jesu, name all names above.”

A considerable list of hymn writers is associated with the Western church. Attention can here be called to but few. Both Hilary of Poitiers (died 366), who gained much of his inspiration from his enforced exile to Asia Minor, and Ambrose, Bishop of Milan (died 397), did much for the music of the Church. Ambrose in particular developed the music of the service of public worship, until the singing of his congregation, led by his trained choir, became widely known and of far-reaching influence. It is feelingly mentioned by Augustine. Over 90 of the hymns of the Ambrosian school are still in existence, a number of which are attributed directly to Ambrose. *Te Deum Laudamus*, “the most famous nonbiblical hymn of the Western church,” has been credited to Ambrose, but critical scholarship now places it as late as the middle of the fifth century, author unknown. Prudentius of Spain (died early in the fifth century) and Sedulius (also of the fifth century), who was born in the British Isles, produced excellent hymns. With Gregory “the Great,” Bishop of Rome (died 604), and Fortunatus, Bishop of Poitiers (died 609), author of *Veni, Sancte Spiritus*, “The royal banner is unfurled,” and of “Welcome, happy morning” as translated by Ellerton, begins the mediæval period of Latin hymnody. In the development of the “Gregorian” system of Church music the office of song was restricted to trained choirs. Many hymns of the Middle Ages are still in use in the Catholic church, and many have been translated or adapted into English and other languages. Among the best known of these hymns are the following *Veni, Sancte Spiritus* (Come, Holy Spirit), attributed to Robert II

of France (died 1031), and *Salve, Caput cruciatum*, by Bernard of Clairvaux (died 1153), from which several familiar English hymns are derived, including "Jesus, the very thought of Thee" and "Jesus, Thou joy of loving hearts." Bernard of Cluny (died 1156) was the author of a long poem, styled by Dr. Neale "Rhythm on the Celestial Country," from which are taken "Brief life is here our portion," "For thee, O dear, dear country," "Jerusalem, the golden," "Jerusalem, the glorious," and other English hymns. One of the grandest hymns of all times is the judgment hymn of Thomas of Calaneo (died c. 1250), *Dies iræ* (Day of wrath). One of the most tender of all hymns is the *Stabat mater* by Jacopone da Todi or Jacobus de Benedictis (died 1306).

Nearly all great religious movements have been accompanied by the use of hymns written directly to aid such movements or because of the phases of religious thought awakened by them. The leaders of these movements from Luther to Moody have found the hymn singing in their public services to be one of the most potent forces in interesting and impressing their followers. A marked illustration is found in the history of the Wesleyan movement, and at the present time may be noted the efforts towards an appropriate hymnody in the Christian Science movement and on the part of those leading the American church in its activities for social welfare.

Among the great results of the Reformation were the use of the vernacular in public worship and a greater participation of the congregation in the services. Whereas to the choirs exclusively had been assigned the musical features of the service, under the Reformation the congregational singing of hymns became of importance.

Luther was the first hymn writer of the German church, enriching its worship with no less than 37 hymns. The best known is *Ein feste Burg ist unser Gott* (A mighty fortress is our God). The first evangelical hymn book of 1524 contained eight hymns. Subsequent editions contained more and more until that of 1553 contains 131. Coworkers with Luther added much to the hymnology of the Church. Jonas, Eber, Alber, Spengler, Hans Sachs, Speratus, and others among the early Reformers published hymns of value. The Bohemian Brethren, notably Michael Weisse (died 1534), furnished a number of hymns in this period. Then hymns breathed a deep spiritual atmosphere. The French Reformation produced the poetical translation of the Psalms by Clément Marot (died 1544) and Theodore Beza (died 1605), the German Reformed hymn book of 1540, published at Zurich, and the Genevan Psalter of Calvin of 1562. In England the Reformers issued Miles Coverdale's *Goostly Psalmes and Spirituall Songes* (London, 1539); Robert Chowley's versification of the Psalter and Litany (1549), and, last and most famous of all, the rendering of the Psalms by Thomas Sternhold and John Hopkins (1560).

The time of the Thirty Years' War was marked by the production of many fine German hymns of a more or less martial character. Writers of hymns prior to 1650 were Opitz, Heermann, Altenburg, who composed part of the battle hymn of Gustavus Adolphus, "Fear not, O little flock, the foe"; Fleming, author of the "Pilgrim Hymn," beginning "In all my deeds"; and Rinkart, who composed the German

Te Deum Nun danket alle Gott (Now thank we all our God).

Germany continued to produce great hymns and hymn writers after this period. Paul Gerhardt (1607-76) wrote 123 hymns. Many have been translated into English, and some are in common use. Probably the most familiar is "O sacred head, now wounded," adapted from Bernard of Clairvaux and translated from Gerhardt by J. W. Alexander and others. Johann Franck (1618-77), burgomaster of Guben, anticipated the Pietists in his mysticism as shown in his hymns. Johann Rist (1607-77) produced 610 hymns, a few having merit. Johann Scheffler, known as "Angelus Silesius" (1624-77), was a writer of force, and some of his hymns are yet used. All the hymns of the period are somewhat mystical in their teachings.

Pietism was a reaction against Protestant Scholasticism and swung to the other extreme of Mysticism. The leaders of the movement, Philipp Jacob Spener (1635-1705) and August Hermann Francke (1663-1727), wrote a few hymns. Christian Friedrich Richter (1676-1711) wrote 33 hymns. Johann Anastasius Freylinghausen (1670-1730) wrote a few hymns, and published the first hymn book of the movement at Halle in 1704. Gottfried Arnold (1666-1714), the Church historian, wrote several hymns of value. Joachim Lange (1670-1744), a friend of Francke, wrote the morning hymn, *O Jesu, suesses Licht* (O Jesus, sweet light). Johann Friedrich Starck (1680-1756), of Frankfurt, wrote 939 hymns. Karl Heinrich Bogatzky (1690-1774) wrote hymns as well as devotional works, and Philipp Friedrich Hiller (1699-1769), of Wurtemberg, among others who might be mentioned, wrote many hymns. The Moravian church has developed a beautiful ritual and has produced many fine hymns, numbers of which have been translated by John Wesley, Miss Catherine Winkworth, and others. Count Nicolaus Ludwig Zinzendorf (1700-60) produced more than 2000 hymns, over 200 of which appear in the English Moravian hymn book "Jesus, Thy blood and righteousness" and "I thirst, thou wounded lamb of God," have been favorite translations from his hymns. Bishop August Gotthelb Spangenberg (1704-92) wrote 10 hymns. That on Christian simplicity, beginning "Holy simplicity, miracle of grace," written as a birthday hymn for his sister, is considered his best. The inspiration of the hymnology of the Evangelical Revival in England can be traced directly to the Moravian Brethren. To this period belong a few other hymn writers of note, such as Joachim Neander (1650-80), sometimes called the "Psalmist of the New Covenant," and Friedrich Adolph Lampe (1683-1729), the author of 30 hymns. Gerhard Tersteegen (1697-1769), a ribbon weaver, produced 111 hymns, some of which are worthy to be placed in the first rank. From Tersteegen we have several hymns by translation, including "Thou hidden love of God" and "God calling yet, shall I not hear?" From this school we have the first introspective hymns of value.

The nineteenth century saw renewed interest in German hymnody, led by Schleiermacher, Harms, and Arndt, resulting not only in new hymns but in the restoration and careful editing of the old. To writers already mentioned should be added the names of Spitta (died 1859), Albert Knapp (died 1864), author and compiler, and Karl Gerok (died 1890).

The French church has produced comparatively few hymn writers, the one notable name in recent times being Cesar Malan (died 1864), author of a great number of hymns, one of which is *Non, ce n'est pas mourir* (No, no, it is not dying)

The hymns of the Evangelical Revival are not by any means the first great hymns produced in England. The Elizabethan period produced the hymns by F B P (the initials may stand for Francis Baker, pater, i.e., priest), "Jerusalem, my happy home" and "O mother dear, Jerusalem," translated from the Latin and variously revised, also the first English hymn book. This was by George Wither and was published in London in 1623. To the next half century belong Robert Herrick (1591-1634), John Milton (1608-74), Henry Vaughan (1622-95), and Jeremy Taylor (1613-67). In the Restoration period Samuel Crossman published *The Young Man's Meditation* (1664), which contains several hymns, a good specimen of which can be seen in Lord Selborne's (Sir Roundell Palmer) *Book of Praise* (1863). Henry More in his *Divine Dialogues* (1668) published seven long hymns on the festivals of the Church. But the greatest lyric poet of the period was Thomas Ken (1637-1711), the good Bishop of Bath and Wells. His evening, morning, and midnight hymns stand at the head of all worship poetry of the English language. The first two—"All praise to Thee, my God, this night," concluding with the 'long-metric Doxology,' "Praise God from whom all blessings flow," and "Awake, my soul, and with the sun"—have never been surpassed and hardly approached. Joseph Addison, his contemporary, furnished a few hymns of an exalted character, including "The spacious firmament above." In 1683 John Mason published *Songs of Praise*, a hymn book which went through many editions. Benjamin Keach published *Spiritual Melody* (1691), the first Baptist hymn book. Among Independents the first hymn book used was *A Collection of Divine Hymns* (1690). The metrical version of the Psalms by Steinhold and Hopkins was followed by that of Francis Rouse (1646), and that in turn by Nahum Tate and Nicholas Brady (1696), which exerted a great influence. The favorite Easter hymn, "Jesus Christ is risen to-day," is a translation by Tate and Brady from the Latin. The tendency, however, came to be less and less to base hymns on the Hebrew Psalter for a whole hymn book. A preparation for the work of Isaac Watts (1674-1748), sometimes called the "father of English hymnody," was thus made. His hymns have been more widely sung than those of any other English writer, with the possible exception of Charles Wesley. His first work, *Horæ Lyricæ*, appeared in 1706, *Hymns and Spiritual Songs* in 1707. Besides these he published *Divine and Moral Songs for Children* (1720), long extremely popular. While many of Watts's hymns are commonplace and contain unmusical lines, others are alive with finely poetical conceptions and expressions. Among the many still in common use are "O God, our help in ages past," "The heavens declare Thy glory, Lord," and "When I survey the wondrous cross." To the school of Watts belongs Philip Doddridge (1702-51), author of "Awake, my soul, stretch every nerve." His hymns were almost all written to follow sermons, reinforcing the truth which had been preached. The

Wesley family, and the men who gathered about them, both in and out of the Church of England, were prolific writers and produced some of the best hymns in the history of the Church. Samuel Wesley (1662-1735) was no mean poet. His son John (1703-91) translated several hymns and mended many more. Samuel, Jr. (1691-1739), wrote some hymns. To Charles (1707-88), however, we must turn as the leader of the lyrical forces of the Evangelical Revival. He wrote over 6000 hymns. Out of 325 standard hymns James King assigns 22 to Charles Wesley, a larger number than is ascribed to any other writer. At the present time not far from 400 of his hymns are in common use, including "Come, thou Almighty King," "Love divine, all love excelling," "Jesus, lover of my soul," and many other favorites. Charles Wesley's hymns include a wider range of subjects than those of any other hymnist. They chronicle the events of the time as well as the devotional experiences of the writer. Some were impromptu. Many have bits of personal history as a background. Around some hymns have grown beautiful stories, the historical data for which are exceedingly slight. The original hymn books of the Wesleys were issued in 13 volumes under the direction of George Osborn (London, 1688-72). Thomas Olivers (1725-99), John Cennick (1718-55), Edward Peronet (1721-92), author of "All hail the power of Jesus' name," and John Bakewell (born 1721), were of the Wesleyan party, while John Gambold, the Moravian (1711-71), Joseph Hart (c. 1712-68), Miss Anne Steele (1717-78), author of "Father, whatever of earthly bliss," John Newton (1725-1807), author of "Glorious things of thee are spoken," William Cowper (1731-1800), author of "O for a closer walk with God," Robert Robinson (1735-90), John Fawcett (1740-1817), Augustus Montagu Toplady (1740-78), author of "Rock of ages, cleft for me," Joseph Swain (1761-96), William Williams (1717-91), and still others were more or less affected by the movement. The hymns of the movement are characterized by greater breadth of view than any previously issued. They include hymns of all kinds, but very few didactic hymns.

Hymns of modern days seem to have been produced by small groups of men representing some movement or belief. (a) The missionary movement produced James Montgomery (1771-1854) as its first hymn writer and Reginald Heber (1783-1826) as its ablest. Both produced many hymns other than missionary. One of Montgomery's best hymns is "Angels from the realms of glory." Among Heber's hymns are "Holy, holy, holy, Lord God almighty," "The Son of God goes forth to war," and, foremost of missionary hymns, "From Greenland's icy mountains," the musical setting of which turned Lowell Mason from banking to music. (b) The Oxford movement was characterized by its hymnological productions as well as its works of devotion and argument. John Keble (1792-1866), author of "Sun of my soul, Thou Saviour dear," with his *Christian Year*, Frederick William Faber (1814-63), the favorite Catholic poet, many of whose hymns are still gaining in popular use, such as "Hark, hark, my soul! angelic songs are swelling," "O Paradise, O Paradise," and "Souls of men, why will ye scatter," sometimes beginning "There's a wideness in God's mercy," Edward Caswall (1814-

78), John Henry Newman (1801-90), author of "Lead, kindly light," and Isaac Williams (1802-65) were the singers of this group. Their work evinced not only a deep piety but an unsurpassed scholarly finish. (c) The Sunday-school movement has originated a vast number of hymns. It has also borrowed freely from the Church hymnals. Many of its hymns have been worthy, while others have been lacking in poetry and dignity. Certain of its hymns with their musical settings foreshadowed the hymns and music of the evangelistic movement. Recent tendencies in the Sunday-school movement have been steadily towards improvement in both hymns and music. In America the publication of Sunday-school hymnals, with words and music printed together, considerably antedated similar Church hymnals. (d) The evangelistic movement of Moody and Sankey brought into the Church a class of hymns widely differing from the greater part of those produced by any other movement. Many were not of high order—in fact, were quite the contrary—while others have had value, though more or less transient. Few hymns of any kind have attained a more instant popularity than Miss Claphane's "There were ninety and nine." Beginning with *Select Hymns, The Gospel Hymns* in six numbers (1875-95) were followed by hymn books whose name is legion and whose copies are millions. The most voluminous writer of this movement has been "Fanny Crosby" (Mrs. Frances Jane [Crosby] Van Alstine), many of whose hymns have merit, and some of which have attained great popularity, as, e.g., "Safe in the arms of Jesus." It should be said that many of the countless imitators of the earlier evangelists have come far from the standards originally set. (e) The Salvation Army has not added much to the hymnology of the Church, it has, however, changed the class of music used and not for the better. (f) The Christian Science movement has produced numerous original hymns and has altered others to suit its peculiar tenets. (g) The most recent movement in hymnody is that of social workers. The hymns collected by the *Survey* and first published Jan. 3, 1914, are deserving of mention.

Four women have written hymns any one of which is worth a lifetime to produce. Mrs. Sarah Flower Adams (1805-48), "Nearer, my God, to Thee"; Miss Charlotte Elliot (1789-1871), "Just as I am without one plea"; Miss Phoebe Cary (1824-71), "One sweetly solemn thought"; and Mrs. Phoebe H. Brown (1783-1861), "I love to steal awhile away."

In America, the Unitarians have produced some remarkable hymn writers, such as John Pierpont (1785-1866), the Longfellow, Henry Wadsworth and Samuel—the latter a leader in Church music, compiler of hymn books, and author of a number of fine hymns, including "Holy Spirit, Truth divine" and "O life, that maketh all things new"; Edmund Hamilton Sears, author of "It came upon the midnight clear"; Theodore Parker, author of "O Thou great friend to all the sons of men"; and Oliver Wendell Holmes, author of "O love divine, that stooped to share" and "Lord of all being, throned afar." The Protestant Episcopal church has to offer the names of Bishop George W. Doane (1799-1859), author of "Softly now the light of day" and "Fling out the banner"; the Rev. William A. Muhlenberg (1796-1879), Bishop George Burgess (1819-66), and Bishop Phillips Brooks,

author of "O little town of Bethlehem." The Presbyterian church has, among others, Thomas Hastings (1784-1872), early worker for improvement in Church music, George Duffield, author of "Stand up, stand up for Jesus", the Alexanders, James W. and Joseph A., Mrs. Elizabeth Prentiss, and Charles S. Robinson, compiler of many hymn books, excellent for their time. The Congregationalists have the names Timothy Dwight (1752-1817), author of "I love Thy kingdom, Lord", Leonard Bacon, author of the hymn for Forefathers' Day, "O God, beneath Thy guiding hand", Rav Palmer, author of "My faith looks up to Thee", Harriet Beecher Stowe, author of "Still, still with Thee, when purple morning breaketh", and Washington Gladden, author of "O Master, let me walk with Thee." The Baptists furnish a long list, including the names of Oliver Holden (1765-1844), better known as the composer of "Coronation", Adoniram Judson, Miss Scourney, Robert Lowrie, William Howard Doane, and Samuel Francis Smith (1808-95), author of "My country, 'tis of thee" and "The morning light is breaking." The Methodists produced the first hymnologist of America, David Creamer, whose *Methodist Hymnology* appeared in New York in 1848. Other Methodist hymn writers are Miss Hannah F. Gould, Thomas Stockton, President William F. Warren, and Prof. Caleb T. Winchester. Among many other American hymn writers who might be mentioned are John Greenleaf Whittier, the Quaker poet, author of "Immoital love, forever full," sometimes beginning "We may not climb the heavenly steep", Daniel C. Roberts, author of "God of our fathers, whose almighty hand", and Katharine Lee Bates, author of another excellent national hymn, entitled "America, the beautiful."

England has produced a great number of fine hymns in recent years. From many names of writers and from countless hymns a few selections will be made. From the Church of England, Christopher Wordsworth, "O day of rest and gladness" and "The day is gently sinking to a close"; Henry Alford, "Ten thousand times ten thousand"; J. S. B. Monsell, "Sweet is Thy mercy, Lord"; John Mason Neale, many of whose translations have here been quoted, author also of many hymns, Sir Henry W. Baker, "The King of Love my shepherd is"; John Ellerton, "Saviour, again to Thy dear name we raise"; William W. How, "O Jesu, Thou art standing"; and "For all the saints, who from their labours rest"; Samuel John Stone, "The Church's one foundation" and "Weary of earth." Among other English writers of note are Horatius Bonar, "I heard the voice of Jesus say" and "Upward, where the stars are burning"; Frances Ridley Havergal, whose hymns of consecration are especially well known, Henry Francis Lyte, whose hymn, "Abide with me, fast falls the eventide," is hardly excelled, S. Baring-Gould, whose "Onward, Christian soldiers" has earned enormous popularity.

Hymns, Ancient and Modern, originally compiled by a committee of which Sir H. W. Baker was secretary, and published in London in 1861, with supplemental hymns published in 1889, *The Congregational Psalmist* (1858), edited by Henry Allon, and *Church Hymns* (1871), edited by Canon John Ellerton, are the greatest hymn books of England. *The Plymouth Collection* (1855), by Henry Ward Beecher, an early ad-

vocate of congregational singing, the Protestant Episcopal *Hymnal* (1871) and subsequent revisions, the Baptist *Praise Book* (1871) and its successors, the *Methodist Hymnal* (1878), recently revised, *Church Song*, by M W Stryker, the *Evangelical Hymnal* (1880), by Hall and Lasar, *Laudes Domini* (1884), one of a notable series by Dr Robinson, *In Excelsis, Hymns of the Faith*, by Harris and Tucker, the *Presbyterian Hymnal* (1895), *Church Hymns and Tunes* (1906), by Turner and Biddle, the very recent *Pilgrim Hymnal*, and the *American Hymnal* (1913)—are noteworthy hymnals of America. They show striking progress in quality of hymns and music as well as in the art of bookmaking. There are several notable hymnological collections in this country. The Lowell Mason library is in Yale University. The Creamer collection is at Drew Theological Seminary, Madison, N J. Hubert P Main has a collection of great value, and Hartford Theological Seminary possesses a large, unique, and most valuable collection.

Bibliography. It has been estimated that there are at least 400,000 hymns in all languages, of which the greatest number are in German and the next greatest number are in English. The literature on the subject is consequently becoming quite large. The great thesaurus of information is J Julian's *Dictionary of Hymnology* (London and New York, 1892, rev ed, 1907), the labor of many years and of many hymnologists. It covers the entire field and contains separate articles upon the hymnology of the different periods and lands. A F W Fischer's *Kirchenlieder-Lexikon* (Gotha, 1878-79) is also very good. For the study of early Greek and Latin hymns the standard work is H A Daniel's *Thesaurus Hymnologicus* (Leipzig, 1855), which gives the text of many hymns, for the Latin medieval hymns, a work of similar rank is F J Mone's *Latinsche Hymnen des Mittelalters* (Freiburg, 1853). For German Protestant hymnology to the seventeenth century, the great work is P Wackernagel, *Das deutsche Kirchenlied von der ältesten Zeit bis zu Anfang des XVII Jahrhunderts* (Leipzig, 1864-77). J M Neale, by his *Medieval Hymns and Sequences* (London, 1851), *Hymns of the Eastern Church* (ib, 1862), and other similar works, contributed much to a knowledge of the hymnology of the Eastern and Western churches of the Middle Ages. A fairly creditable book on Latin hymns is S W Duffield's *Latin Hymn-Writers and their Hymns* (New York, 1889). A recent book is D J Donahue's *Early Christian Hymns* (1st and 2d series, Middletown, 1908, 1911).

Consult Josiah Miller, *Singers and Songs of the Church* (New York, 1869), J E Prescott, *Christian Hymns and Hymn-Writers* (London, 1883), W G Horder, *The Hymn Lover* (ib, 1889), Duncan Morrison, *The Great Hymns of the Church: Their Origin and Authorship* (ib, 1890), A E C, *Hymns and their Stories* (New York, 1894), R E Welsh and F G Edwards, *Romances of Psalter and Hymnal* (ib, 1896), W T Stead, *Hymns that Have Helped* (ib, 1897), Duncan Campbell, *Hymns and Hymn-Makers* (London, 1898), Butterworth and Brown, *Stories of the Hymns and Tunes* (New York, 1907), L F Benson, *Studies of Familiar Hymns* (ib, 1908). For the biography of a hymnologist, consult H Housman, John Ellerton. *A Collection of his Writings on*

Hymnology, with a Sketch of his Life (London, 1896). On German hymnology, consult Winkworth, *Lyra Germanica* (London, 1855) and *Christian Singers of Germany* (ib, 1869), and for the hymns of Luther especially, Bacon, *Hymns of Martin Luther* (New York, 1883). There are several commentaries on hymns that are very well done. Hyde, *Hymnal Sermon Pictures* (ib, 1899), does what is done nowhere else and is most complete in the analysis of the hymns he discusses. Commentaries on denominational collections are Biggs, *Hymns, Ancient and Modern* (London, 1867), giving annotations on the hymns of the Church of England. Nutter, *Hymn Studies* (New York, 1884, 3d ed, 1902), based on the American *Methodist Hymnal*, Burrage, *Baptist Hymn Writers and their Hymns* (Portland, Me, 1888), Tillet, *Our Hymns and their Authors* (Nashville, Tenn, 1889), the annotated edition of the *Hymnal* of the Methodist Episcopal Church South, Robinson, *Annotations upon Popular Hymns* (New York, 1893), based on his *Laudes Domini*, Stevenson, *The [British] Methodist Hymn-Book*, illustrated (London, 1883), from which S W Duffield drew many of the facts and anecdotes given in his *English Hymns* (New York, 1886), intended as a commentary on Robinson's *Laudes Domini*, Price, *Music and Hymnody of the Methodist Hymnal* (ib, 1911), *Hymns and Hymn Writers of the Church* (ib, 1911). The best anthologies of religious lyric poetry are *The Book of Praise* (London, 1862, many subsequent editions), by Sir Roundell Palmer (Lord Selborne), and F T Palgrave, *The Treasury of Sacred Song* (ib, 1889). See HYMN TUNES.

HYMNS. See HYMNOLOGY.

HYMNS, NATIONAL. See NATIONAL HYMNS.

HYMN TUNES. The authentic history of hymn tunes begins with Hilary of Poitiers, who died in 368. His music was simpler than that of the ordinary jublations, each syllable of the text being given but one or, at the most, two musical tones. St Ambrose (died 397) and, later, Pope Gregory the Great (died 604) introduced radical reforms in the style and singing of hymns (see AMBROSIAN CHANT, GREGORIAN CHANT), and the impetus given by them to the plain chant (qv) carried that form along for centuries. It is noteworthy that even so early in many cases the author of the words also wrote the accompanying melodies. With the growth of polyphonic music these old chants were used as *canti fermi* upon which the more elaborate forms of masses and motets were constructed. Under Palestrina (qv, died 1594) the polyphonic hymn reached its highest development. Around the historic plain chants he embroidered a wealth of contrapuntal devices, yet preserving throughout their original smoothness and beauty. The difficulty of the music is the one objection against their more general use.

Meanwhile a reaction had arisen against the heavy, sombre music which had heretofore been the sole style of hymn tunes. Between the acts of Mystery Plays, and especially at those given at Christmas time, it was customary to sing songs whose general trend was religious, but whose music was light and popular. The Reformation was imminent, and Luther appreciated and seized the opportunity for an innovation in Church music. He adapted some of these popular tunes to German translations of Latin hymns, wrote some original words, and

the whole was set for four, five, or six voices by Johannes Walther. Most important in this connection is the fact that for the first time in the history of hymn tunes the music was rhythmic. This was the beginning of the chorale (qv), which became immediately and widely popular. The next great period in Germany begins with Johann Sebastian Bach (1685-1750), who, while emphasizing the rhythmic element, at the same time developed the structural side of the music. After him the decline was rapid.

In France Clément Marot (died 1544) and Theodore Beza (died 1605) wrote metrical psalms which were set to popular music. Goudimel (1505-72), the earliest national composer, wrote many hymn tunes, but then difficulty rendered negative their excellence, and they were supplanted by the simpler arrangements of Claudin le Jeune (died 1600). Of the later French hymn writers the most important was Cesar Malan, of Geneva (1787-1864), who composed melodies to his own words. In England the history of hymn tunes follows much the same line as on the Continent. There were no hymns proper until the eighteenth century, before that time Tallis (died 1585), Byrd (died 1623), Parsons (died 1570), etc., set psalms to revised forms of old Continental tunes, and in 1621 "the Whole Booke of Psalmes" was published. The music of this edition was arranged largely by Thomas Ravenscroft, the tunes having been set by Bennet, Morley, Tallis, etc. With Orlando Gibbons (1583-1625) the polyphonic school in England came to an end, and the later compositions of Carey (died 1743), Wainwright (1792-1854), and their successors were poor in comparison. The reforms of the Commonwealth did nothing for Church music, and it was not until Purcell (1658-95), the greatest native English composer, that a lighter, more varied note was introduced into hymn tunes. The hymns of Watts (1674-1748) marked the beginning of the popular epoch, and those of Charles Wesley (1707-88) its high-water mark. In recent years choral music and hymn tunes have drawn more closely together, to the immeasurable advantage of the latter. In England especially, Dykes (1823-76), Barnby (1838-96), Stainer (1840-), and others have all written excellent music. At the same time, however, many hymns have been written in England and the United States whose music depends wholly for its success on its catchy, not to say vulgar, character. Most representative of this class are the hymns of Moody and Sankey. Of the many collections of tunes compiled since the middle of the nineteenth century, especially in England, the most notable is that published in 1861 by the Rev. Sir Henry Baker under the title *Hymns Ancient and Modern*. Revised and enlarged editions appeared in 1868, 1875, 1889, 1904, and 1910. For a more detailed account of hymn tunes, consult Butterworth, *Story of the Tunes* (New York, 1890), Love, *Scottish Church Music* (London, 1891), Curwen, *Studies in Worship Music* (ib, 1894), Cowan and Love, *Music of the Church, Hymnary and Psalter in Metre, its Sources and Composers* (ib, 1901), Mees, *Choirs and Choral Music* (New York, 1901), Dickinson, *Music in the History of the Western Church* (ib, 1902), E. S. Lorenz, *Practical Church Music* (ib, 1909), P. C. Lutkin, *Music in the Church* (Milwaukee, 1910). See also HYMNOLOGY.

HYNDMAN, HENRY MATERS (1842-) An English journalist and Socialist leader, born in London. He graduated at Trinity College, Cambridge, and began to study law in 1863, but three years later, as correspondent for the *Pall Mall Gazette*, went to the war in progress between Austria and Italy, where he became the friend of Mazzini, Garibaldi, and other patriots. Between 1869 and 1871 he traveled in Australia, New Zealand, and Polynesia, and while in Melbourne wrote articles for the *Argus* in the cause of free education. He founded the Social Democratic Federation in 1881 and from that time was a conspicuous reform agitator. He was chairman at the International Socialist Congress held in London in 1896 and assisted at the formation of the new International at Paris in 1900. He was an Irish land leaguer and a pro-Boer during the second Boer War. From 1900 to 1910 he was a member of the International Socialist Bureau, and he contested Burnley in 1895, 1906, and 1910. From 1874 he used his pen diligently in the Socialistic cause. His books include *Indian Policy and English Justice* (1874), *Bankruptcy of India* (1886), *England for All* (1881), *Historical Basis of Socialism* (1883), *A Commune for London* (1888), *Commercial Crisis of the Nineteenth Century* (1892, 3d ed., 1908), *Economics of Socialism* (1896), *The Record of an Adventurous Life* (1911), *Further Reminiscences* (1912).

HYOGO, hyō'gō. A part of the Japanese town of Kobe (qv).

HYOID BONE (from Gk ὑοειδής, *hyoeidēs*, shaped like the Greek letter upsilon, from ὕ, *y*, upsilon + εἶδος, *eidos*, shape). The tongue bone, or V-shaped bone. It is sometimes spoken of as unimportant in man, compared with the so-called hyoid bone in many of the lower animals, in which, on account of its being a support for bronchial apparatus, it is often developed to a great size. But its importance is no less in man, because of its connection with many muscles, the perfection of its form and its exact location at the base of the tongue being a considerable element in the apparatus for the formation of articulate and musical sounds.

HYOLITHES, hī-ōl'i-thēs (Neo-Lat nom pl from Gk ὕ, *y*, upsilon + λίθος, *lithos*, stone). An important and common fossil of the Cambrian rocks, and found also, though less commonly, in the higher rocks up to and including those of the Permian system. The shells of this mollusk are slender, conical tubes, often curved, and with triangular or flattened cross sections. Some are provided with a lid to close the aperture. The old genus *Hyolithes* has been elevated to a family rank, and the numerous species have been distributed among several new genera. The hyolithids are very common in many of the Lower Cambrian rocks, and they are indeed among the very oldest fossils known. They have been classed as pteropods, and more recently as worm tubes, with the probabilities in favor of the latter relation. Some authors have also considered the hyolithids to represent quite nearly the most primitive form of gastropod. Consult Novak, "Revision der paläozoischen Hyolithiden Bohmens," in *Abhandlungen der böhmischen Gesellschaft der Wissenschaften*, series 7, vol. 14 (Prague, 1891), Holm, "Sveriges Kambrisk-Siluriska Hyolithida och Conulariidae," in *Afhandlingar Sveriges Geologiska Undersökning*, series C, no

112 (Stockholm, 1893), Walcott, "Fauna of the Lower Cambrian or Olenellus Zone," in *Annual Report of the United States Geological Survey*, vol. x (Washington, 1893), Matthew, "Illustrations of the Fauna of the St. John Group," in *Transactions of the Royal Society of Canada*, vols. 1 to v (Montreal, 1883-91)

HYOSCYAMINE, hī'ō-sī'a-mīn See ALKALOIDS

HY'OSCY'AMUS See HENBANE, BELLADONNA

HYPÆTHRAL, hīp-ē'thral, **HYPÆTHROS**, hīp-ē'thros (open to the sky, a structure open to the sky) A term applied by Vitruvius (iii, 1) to a temple with a central unroofed space See TEMPLE

HYPATIA, hī-pā'shī-a (Lat. from Gk. *Ἥπαρια*) Daughter of Theon, an astronomer and mathematician of Alexandria and head of the Neoplatonic school in that city, early in the fifth century. She is famed alike for her beauty, her purity, her wisdom, and her tragic fate. Her father gave her the best training the philosophy of the time could furnish, and she succeeded him as lecturer at Alexandria, her fame drew students from all parts of the East, where the influence of Greek thought and knowledge was felt. The citizens of Alexandria were proud of her, and such reliance was placed upon her judgment and sagacity that the magistrates used to consult her on important cases. Among those who were most intimate with her was Orestes, prefect of the city. At this time the Bishop of Alexandria was Cyril (qv), between whom and Orestes there had arisen a dissension on the question of jurisdiction. "It was commonly reported among the Christians," says Socrates, the Church historian, "that it was by her influence he [Orestes] was prevented from being reconciled with Cyril. Some of them, therefore, whose ringleader was a reader named Peter, hurried away by a fierce and bigoted zeal, entered into a conspiracy against her, and observing her as she returned home in a carriage, they dragged her from it and carried her to a church called Caesareum, where they completely stripped her and then murdered her with shells. After tearing her body to pieces, they took her mangled limbs to a place called Cynaron, and there burned them." This occurred in March, 415. As at the time Synesius (qv) met her (about 395) she had been for 20 years a famous lecturer, and as she lived 20 years after that, she must have been at least 60 years old when murdered, but in legend and fiction she is represented as of unfaded physical charm. She is the heroine of Charles Kingsley's *Hypatia, or New Foes with an Old Face* (1853). Synesius has preserved a few of her letters. Consult Meyer, *Hypatia von Alexandria, ein Beitrag zur Geschichte des Neuplatonismus* (Heidelberg, 1886), and J. B. Bury, *History of the Later Roman Empire*, vol. 1 (New York, 1889).

HYPERÆMIA See BIER'S HYPERÆMIA, MEGRIMS

HYPÆSTHESIA (Neo-Lat. from Gk. *ὑπέρ*, *hyper*, over + *αἰσθησις*, *aisthēsis*, sensibility, from *αἰσθάνεσθαι*, *aisthanesthai*, to perceive through the senses) and **HYPERALGESIA** "Hyperæsthesia" is a term commonly though less correctly used to designate increased sensibility to pain, the proper term being "hyperalgesia." It is believed that there is no increase of sensibility to touch or to heat and cold over

the normal, though tactile and thermal sensibility may be diminished under various conditions. Unpleasant sensation or actual pain may be caused by a light touch on the surface and is due to irritation of oversensitive end organs of common sensibility (i.e., pain) and not to increased perception of touch. Hyperalgesia is due to peripheral, spinal, or cerebral irritation of sensory nerve fibres. Increased cutaneous sensibility occurs in meningitis, cerebral or spinal, tetanus, hysteria, traumatic neuroses, hydrophobia, in neuritis and multiple neuritis, and in some fevers. Local hyperalgesia occurs in inflamed areas, as around carbuncles, burns, or rheumatic joints. See ANÆSTHESIA

HYPERBOLA (Gk. *ὑπερβολή*, *hyperbolē*, hyperbola, excess, from *ὑπερβάλλειν*, *hyperballein*, to exceed, from *ὑπέρ*, *hyper*, over + *βάλλειν*, *ballein*, to throw) One of the conic sections (qv). Analytically the hyperbola is the locus of a point which moves so that its distance from a fixed point, called the focus, bears a constant ratio greater than unity to its distance from a fixed straight line, called the directrix. In the figure *F* is the focus and *d* the directrix for the branch on the right, *F'* is the focus and *d'* the directrix for the branch on the left, *XY* is the transverse axis, *Y'Y* the conjugate axis, and *l* is the latus rectum. The equation of the hyperbola referred to the rectangular axes *XX'*, *YY'* is $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, in which *a* = *OV*, and *e* is the given ratio. Since *e* > 1, *a*²(1 - *e*²) is negative. Putting -*b*² for this negative quantity, the standard form of the equation is $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. The curve *MN*, *PQ* is the conjugate hyperbola with respect to the hyperbola *AB*, *CD*. (See CONJUGATE) The hyperbola is

HYPERBOLA

the only conic section having real asymptotes. These are the lines *TT*, *T'T'* in the figure. The equation of the hyperbola referred to its asymptotes is *xy* = *ab*. A hyperbola whose asymptotes are perpendicular to each other is called a *rectangular* or *equilateral* hyperbola. These asymptotes have the following remarkable property. If, starting from *O*, the asymptotes are divided in continued proportion, and from the points of section lines are drawn parallel to the other asymptote, the areas contained by two adjacent parallels and the corresponding parts of the asymptote and curve are equal.

HYPERBOLE, hī-pēr'bō-lē The name given to a figure of rhetoric by which expressions are employed that, taken literally, signify more than is really meant. The use of the figure is to arrest the attention. Hyperbole is the basis

of many metaphors. Thus, we call Nero a monster, Tamerlane a tiger, and so on. See RHETORIC, FIGURES OF.

HYPERBOLIC LOGARITHMS. See LOGARITHM.

HYPERBOREANS (Gk *ὑπερβόρειοι*, *Hyperboreoi*, beyond the north wind, from *ὑπέρ*, *hyper*, above, beyond + *βορέας*, *boreas*, north wind). A name given by the ancients to a mythical people dwelling in the distant north, beyond the Rhipæan Mountains, where it was everlasting day and perpetual spring, and where sorrow and old age were never found. The name was often applied to any people who lived in the Far North. The Hyperboreans may have been originally those who brought to Apollo gifts and sacrifice. Consult Crusius, "Hyperboreer," in Roscher, *Lexikon der griechischen und römischen Mythologie*, vol. 1 (Leipzig, 1884-90), Mannhardt, *Wald- und Feldkulte* (1905), Farnell, *Cults of the Greek States*, vol. iv, 100 ff (London, 1907). For an ancient discussion, skeptical in tone, of the myth of the Hyperboreans, consult Herodotus, iv, 32 ff, and the notes on the passage in the edition of Herodotus by How and Wells (Oxford, 1912).

HYPERCALVINISM. That form of Calvinism which carries the system to its extreme logical conclusions, holding, e.g., to a double predestination (to evil as well as good), as in the Canons of Dort, and atonement only for the elect, as in the Second Helvetic Confession. Consult Schaff, *Creeds of Christendom* (New York, 1881).

HYPERCHIMÆRA, hī'pēr-ki-mē'ra. A term applied to a plant produced by the union of two others by grafting in such a manner that portions of each are aggregated into a sort of patchwork or mosaic. As it is a sort of graft hybrid, it is discussed under GRAFT HYBRIDS and CHIMÆRA, IN PLANTS (qqv).

HYPERÆMIA. See HYPÆMIA.

HYPERGEOMETRY. See GEOMETRY, *Hypergeometry*.

HYPERIDES (Lat, from Gk *ὑπερίδης*, *Hyperidēs*). An Athenian orator of the fourth century B.C., one of the 10 comprised in the Alexandrian canon (See CANON ALEXANDRINUS). After studying philosophy under Plato and oratory under Isocrates, he began his public career as an advocate in the Athenian courts of justice and joined the patriotic party, at that time led by Demosthenes and Lycurgus. He fitted out two triremes at his own expense for the Eubæan expedition of 358 B.C. In 338 B.C., when the disastrous fight of Chæronea (qv) laid Greece at the mercy of Philip of Macedon, Hyperides proposed that the citizens should send their wives and children to places of security and fight it out to the last. Though this desperate advice was not taken, its genuine patriotism was appreciated and rewarded by his countrymen. When the death of Philip revived the hopes of the anti-Macedonian faction, Hyperides promoted the alliance with Thebes, and after the destruction of that city by Alexander was one of the orators demanded of the Athenians by the Macedonian King. Alexander, however, did not press his demand, and Hyperides continued to oppose the Macedonian influence as strongly as ever. The arrival in Athens of Harpalus (qv), the runaway treasurer of Alexander, then absent on his Eastern conquests, disturbed the friendly relation that had hitherto existed between Hyperides and Demosthenes, for

in this celebrated case Hyperides, as one of the few anti-Macedonians who were above suspicion, was chosen to prosecute his friend (See DEMOSTHENES). In the Lamian War (qv), which followed the death of Alexander, Hyperides took a leading part, and he spoke the funeral oration over his countrymen who had perished in battle. The year 322 B.C. saw the hopes of Athens finally crushed at the battle of Crannon. The chiefs of the patriotic party sought safety in flight. Hyperides was overtaken at Ægina by the agents of Antipater and put to death. Tradition says that his tongue was torn out by his captors, or that he bit it out to avoid betraying his friends. As an orator, Hyperides was ranked high by the ancients, it is said that some critics preferred him to Demosthenes. The "grace" of his speeches was especially praised. The writer of the *Lives of the Ten Orators* enumerates 75 speeches, of which 52 were considered genuine. Until recently these were known only in scanty fragments, but in the last century a number of papyri were discovered in Egypt which contain six speeches in a fairly complete state, including the famous funeral oration mentioned above. This fully justifies the praise of the ancient critics and may be ranked as one of the finest products of Greek oratory. A complete edition of the speeches and fragments, with bibliography, has been published by Blass (Leipzig, 1894). The orations *Against Athenogenes* and *Against Philippides* have been edited, with an English translation, by Kenyon (London, 1893). Consult Jebb, *Attic Orators*, vol. ii (London, 1880), Blass, *Attische Beredsamkeit*, vol. iii (Leipzig, 1893), Wright, *A Short History of Greek Literature* (New York, 1907), Christ-Schmid, *Geschichte der griechischen Literatur*, vol. 1 (5th ed., Munich, 1908).

HYPERION. See TITANS.

HYPERION. 1 A poetic fragment by John Keats (1820). 2 A romance by Longfellow, published in 1839.

HYPERIUS, ANDREAS GERHARD (1511-64). A Protestant theologian and reformer, born at Ypres, whence his learned name Hyperius, Gerhard being his family name. He was educated at the University of Paris and traveled in the Netherlands and in Germany. Driven from England (where he lived four years with William Mountjoy, Erasmus' friend) by the persecutions of 1540, he went to Germany, was converted to Protestantism, and became professor of theology at Marburg. A deep scholar and a liberal theologian, he was accused of Zwinglian views on the Lord's Supper. He wrote *Methodi Theologiæ Libri III* (1566), *De Formandis Conciombus Sacris* (1553), *De Recte Formando Theologiæ Studio* (1556), the first scientific dictionary of theology.

HYPERMETAMORPHOSIS. Set METAMORPHOSIS.

HYPERMETROPIA. See SIGHT, DEFECTS OF.

HYPERMNES'TRA (Lat, from Gk *ὑπερμνήστρα*). One of the Danaids. She alone of the daughters of Danaus (qv) disobeyed his command, she did not slay her husband, Lynceus, but was eventually pardoned by her father.

HYPEROPIA (from Gk *ὑπέρ*, *hyper*, above + *ὄψις*, *opsis*, sight). A congenital or acquired error of refraction of the eye. Owing to too little convexity of the refracting surfaces, parallel rays of light do not converge to a focus on the retina, as in the normal eye, but to a

point somewhere behind the same. It is usually called hypermetopia, long-sightedness, and is the opposite of myopia.

HYPERSPACE See GEOMETRY

HYPERSTHENE (from Gk *ὑπέρ*, *hyper*, over + *σθένος*, *sthenos*, strength) An iron-magnesium silicate, classed in the orthorhombic section of the pyroxene group. With a decreasing proportion of iron hypsthene grades into enstatite (qv). It crystallizes in orthorhombic forms, but is also found in granular masses. Associated with labradorite and other basic feldspars, it is an important constituent of certain eruptive rocks, such as gabbro and norite, and is widely distributed. When cherry red in color, it may be cut and polished and used as an ornamental stone.

HYPERSTHENE GABBRO See GABBRO

HYPER/TROPHY (from Gk *ὑπέρ*, *hyper*, over + *τροφή*, *trōphē*, nourishment, from *τρέφειν*, *trēphein*, to nourish) The term applied in medicine to the abnormal and disproportionate enlargement of any part of the body. Examples of this change are seen in the muscular system, where it may occur altogether independently of disease. The huge bosses of flesh that stand prominently forward in the arm of a blacksmith or of a pugilist and in the leg of a ballet dancer are illustrations of hypertrophy from increased use, where the general health may be perfect. In double organs, such as the kidneys and lungs, if the organ on one side degenerates through disease, the organ on the opposite side is often found to enlarge and carry on double work. In these cases hypertrophy is an effect of disease, but is at the same time a preservative of life. It is called compensatory hypertrophy.

There are, however, cases in which the hypertrophy has a hurtful instead of a conservative effect, as, e.g., hypertrophy of the thyroid gland, constituting the disease known as goitre, or bronchocele, hypertrophy of the prostate gland, of the spleen, etc. The following are the etiological factors of hypertrophy: 1 It may be congenital. 2 A local increase in the supply of blood to a part, whether due to increased exercise, or irritation by mechanical or chemical agents, etc. 3 It may be due to old age—the so-called senile hypertrophy, the commonest example of which is the enlargement of the prostate gland in old men, which is said to occur in about 40 per cent of all men after the age of 50 years. 4 Syphilis and chronic inflammations are also very common causes of hypertrophy. See HEART, DISEASES OF THE

HYPHA (Neo-Lat nom pl, from Gk *ὕφη*, *huphē*, web) An individual filament of the body of a true fungus. The vegetative body of a true fungus is called a mycelium, which consists of a web of filaments (usually colorless) which is of various textures, dependent upon the closeness of the weaving. A mycelium may be as delicate as a cobweb, or it may be as compact as a piece of felt. Each individual thread or filament of this woven body is a hypha. Hyphæ constitute not merely the units of structure of the fungus body, but they also arise from the mycelium to bear spores, and they also enter the substratum to secure nutrition. See FUNGI

HYPNAL (from Gk *ὑπναλός*, *hypnaleos*, causing sleep, from *ὑπνος*, *hypnos*, sleep, connected with Lat *somnus*, *sopor*, AS *swefen*, Skt *svapna*, sleep, from *svap*, to sleep) A

hypnotic of value, combining the effects of chloral hydrate and antipyrine, of which it is composed. Its chief use is found in cases of sleeplessness due to pain.

HYPNOS (Lat, from Gk *ὕπνος*). The Greek god of sleep, the son of Erebus and Night, and twin brother of Death. He is represented as a youth with wings, bearing a poppy branch and the horn of slumber.

HYPNOSCOPE (from Gk *ὑπνος*, *hypnos*, sleep + *σκοπεῖν*, *skopein*, to view) A magnet devised to measure hypnotic sensitiveness. The magnet is a slit tube 3.4 centimeters in diameter by 5.5 in length and weighs 169 grams. It is very powerful, lifting 25 times its own weight. The instrument is applied by removing the armature and inserting the forefinger of the person to be tested into the magnet so as to touch both poles at once. After two minutes sensitive or objective effects will be noticed in 30 per cent of persons tested. It is not an instrument of any value whatever. Hypnotic influences cannot be measured by any known mode at the present time.

HYPNOTICS (from Lat *hypnoticus*, Gk *ὑπνωτικός*, *hypnotikos*, relating to sleep, from *ὑπνος*, *hypnos*, sleep) Agents which are used to induce sleep. During the state of slumber, especially if deep, the functional activity of the cerebral centres is largely suspended. Medullary centres remain active, but are less alert. The brain and spinal cord are anæmic, reflex action is diminished, and the senses are dulled. The ordinary precautions of one about to sleep—the recumbent position, the darkened and quiet room, the absence of previous excitement—are simply evidences of physiological necessity. Hypnotics act ordinarily by diminishing the functional activity of the brain or by causing an anæmia of it, occasionally by both methods. They may be divided into four classes.

(A) *Mental*, acting by diminishing the functional activity of the cerebrum. This class includes the constant repetition of prayers, etc., the counting up into the hundreds or thousands, the counting imaginary sheep as they jump an imaginary wall, and many similar expedients. These are only of value in light grades of insomnia.

(B) *Dietetic*. This class causes a congestion of the abdominal viscera by increasing their functional activity and thus leads indirectly to cerebral anæmia. A light supper of crackers and cheese, or oysters, or soup, or beef tea, is often of great value for inducing sleep. Frequently the addition of a little alcohol as a weak toddy, or a bottle of beer, will help.

(C) *Mechanical*, including 1 *Hot-Water Bag* or *Brick* to the feet, of value when the extremities are cold. It acts by indirectly causing cerebral anæmia. 2 *Moist warmth* to abdomen by a poultice or hot compress covered with oil silk. This is frequently of value. It acts by dilating the abdominal vessels, and thus causes cerebral anæmia. 3 *Hot Bath*. This acts by dilating the cutaneous vessels and thus causing cerebral anæmia. Certain precautions should be observed. The bed should be well warmed, and the room moderately cool. The bath should be hot, and the individual should stay in it for several minutes. He should be dried as quickly as possible, and in passing from the bath to the bed he should be well wrapped up and wear warm slippers. This method is often of great value when properly applied. It should be used with caution in cases of heart disease. 4.

Chapman's Method. This consists in the application of cold to the spine. It indirectly causes dilatation of the abdominal vessels and thus cerebral anæmia. 5 *Massage.* This should be general and thorough, especially to the abdomen. It acts by dilating the vessels of the body and also by lessening the irritability of the sensory cutaneous nerves. If the ordinary precautions of quiet and darkness are observed after the massage, this method frequently acts very well. All the preceding measures are of little value in case any acute disease is present. In such cases, and many others, we have to resort to drugs. These should not be used for ordinary insomnia until a thorough trial has been given to the dietetic and mechanical hypnotics. None should be given except under the advice of a physician who has examined the patient. They are, of course, grouped under the class (D) *Medicinal*. 1 *Opium* and its derivatives. As simple hypnotics, these are all objectionable, for they produce other marked effects than sleep. The danger of a habit forming must also be considered. In acute diseases, especially when accompanied by pain or delirium, they are of great value. Codein is the least objectionable, but it is also the most expensive and the least efficacious. 2 *Hyoscyamus* and its derivatives. These are not of so much value as are ordinary hypnotics, for they cause other marked effects. In cases of mania they are of great value. Hyoscyne hydrobromate has the most decided hypnotic action. 3 *Cannabis Indica.* Feeble in hypnotic power. The sleep produced by it is apt to be preceded by delusions often unpleasant. 4 *Chloral Hydrate.* This is a very valuable hypnotic. It has some objections. A very important one is the tendency to the formation of a habit. Another is the difference in susceptibility to its action. Chloral hydrate is a powerful cardiac depressant, and in cases of heart disease or heart weakness from any cause it should be used with great caution, if at all. A small dose has caused death, although 50 and 60 grains have been given in other cases without harm. 5 *Bromides.* These are not very powerful hypnotics, but are still very efficacious and comparatively harmless. Potassium bromide is the most useful, but sodium bromide, though less active, is not so depressing to the circulation. 6 *Monobromated Camphor.* A feeble hypnotic. 7 *Paraldehyde,* a polymeric modification of acetic aldehyde. This is an efficient hypnotic, producing sleep, as a rule, in half an hour. As regards its nervous effects, it is almost a pure hypnotic, and it causes but slight depression of the heart and respiration. It leaves no after effects except the odor of the breath, which is often very marked, and it may cause nausea or vomiting if the stomach is very irritable. Like all hypnotics, it sometimes fails. 8 *Sulfonal.* This is an efficient but slow-acting hypnotic. The dose is given one or two hours before the expected sleeping time. 9, 10 *Trional* and *Tetional* are similar drugs, with more rapid and powerful action. The three last named may produce poisoning if used for any length of time or in too large doses. 11 *Urethane,* ethyl carbonate, $C_2H_5CO_2NH_2$, has a bitter, disagreeable taste. This is an efficient hypnotic, leaving no disagreeable after effects. In large doses it may cause vomiting, but is otherwise a pure hypnotic. It has no depressing action on the heart or respiration. 12 *Amylene Hydrate.* A colorless fluid with a sharp taste

and smell. This is an efficient hypnotic, causing sleep in 15 to 45 minutes. The sleep is natural, and there are no bad after effects. It has no depressing effects on the heart or respiration. It has caused in a few cases a delirium resembling that of alcoholic intoxication, but followed by refreshing sleep. 13 *Amylene Chloral,* or *dormiol,* is similar in action. 14 *Veronal,* a later production, has in a large measure superseded many of the older hypnotics. It is claimed to be the safest and least apt to induce a habit, but not a few cases of poisoning have been reported, as well as of habit formation. Most of the drugs named are considered in special articles under their names.

HYPNOTISM, HYPNOSIS (from Gk *ὑπνος, hypnos,* sleep). The general names for a group of abnormal phenomena, physical and psychical, which show a close outward resemblance to the phenomena of normal sleep and of sleep walking. The symptoms of the hypnotic state differ considerably among different subjects, and the making off of distinct stages within this state is rather a matter of theory than of actual observation. The artificial sleep is continuous and progressive, beginning with a languor and drowsiness not unlike those of a man suddenly waked from sound sleep, or arousing from a too protracted morning's nap after a disturbed night. As the state advances, the subject becomes partially anæsthetic, insensitive to pin pricks, pinching of the skin, etc., his sense organs are closed to most of the impressions from his surroundings that would normally excite them, if awakened before the sleep has grown more profound, he remembers hazily what has occurred during hypnosis. He is extremely suggestible at the hands of those who, as he thinks, have induced the sleep and will execute movements that the experimenter prescribes to him. The voluntary muscular system evinces a curious rigidity and fixity, the subject will remain in any position in which he is placed. This feature has given the name of "catalepsy" (seizure) to the stage in question. As the sleep is continued, the subject becomes still more anæsthetic, until consciousness seems to lapse altogether, on waking, he has no memory whatsoever of the hypnotic period. The name of "somnambulism" is given to a stage of profound hypnosis in which illusions are produced at the experimenter's suggestion: the subject takes ink for wine, a pillow for a baby, steps carefully over an imaginary book, etc.

These phenomena of sleep or trance, mixed with much that is simply charlatanry, have been discussed and exploited from time immemorial. The medicine men of primitive and savage tribes, the magicians of Egypt and Chaldaea, the Hindu ascetics, the monks of Mount Athos, the quack physicians of all ages, have made use of hypnotism to enhance their personal prestige, to cure the sick, or to induce states of religious ecstasy. The modern history of hypnotism begins with F. A. Mesmer (1733-1815), a German physician who practiced hypnotic therapeutics at Paris from 1778, causing so great a stir in scientific circles that his pretensions were made a matter of inquiry by a royal commission (1785). The report of the commission was unfavorable, but "mesmerism" still flourished. In England valuable works were published in the early forties by J. Braid, a Manchester surgeon (c. 1795-1860), but their sanity and importance have but recently been fully recognized. Braid coined

the word "neurohypnotism," or nerve sleep, from which comes the modern word "hypnotism." During the last third of the nineteenth century the facts of hypnosis were thoroughly investigated by physiologists and psychologists Heidenhain and Preyer in Germany, Richet, Charcot, Liebauit, and Bernheim in France, Delboeuf in Belgium, confirmed and extended Braid's results. The French investigators split into two distinct "schools"—that of Charcot and his followers at the Paris Hospital of the Salpêtrière, and that of Bernheim and his followers at Nancy. The Salpêtrière school maintains that hypnotism is a pathological phenomenon, akin to hysteria, and characterized by three well-marked stages, the school of Nancy asserts that it can be set up in the normal individual, that it is a unitary and progressive state, and that the key to its understanding is given with the facts of suggestion. The latter views have found general acceptance, but the controversy undoubtedly hindered the advance of knowledge and threw discredit upon the whole subject. It need hardly be said that the doctrines known as animal magnetism, electrobiology, odism or odyism, mesmeric clairvoyance, etc., are one and all—save in so far as they cover the facts of hypnotism proper—fanciful and ungrounded hypotheses.

In considering the psychology of the hypnotic state we have first to notice that its sole and essential condition is an exaggerated state of passive attention to some object or person. (See ATTENTION.) In popular phraseology there is a "total surrender of the will" of the subject, either to a sense impression or to the experimenter's personality. The condition of hypnosis thus lies—and this fact is of extreme importance—in the mind of the subject himself, the experimenter or "operator" has no power, except as the subject gives him power. The reason that the professional hypnotist and the physician are accredited with a special ability to induce hypnosis is, first, that they "suggest" to the inquirer—whether consciously, by strongly worded advertisement, or unconsciously, by the mere authority of position—that such ability resides in them, and, secondly, that they acquire, in the course of their experience, a tact or insight concerning the best means of bringing the inquirer into the necessary attentive state. The subject comes to them prepared for hypnotization, and they make conditions easy for its attainment. Further than this the ability of the operator does not extend. It is, indeed, entirely possible to hypnotize oneself. (See AUTOSUGGESTION.) Most of us have at times "let ourselves go" mentally, until we were on the verge of what seemed to be a kind of fascination or trance, at the brink of which we aroused ourselves with a start. If now we place ourselves under circumstances favorable to sleep, cutting off, so far as may be, external impressions, and attend concentratedly to the idea of hypnosis, we presently drop into a similar state of "fascination," which soon becomes hypnosis proper and later passes off as ordinary sleep.

We notice, secondly, as a corollary to what has just been said, that all persons of normal constitution are hypnotizable. Hypnosis is "abnormal" only in the sense in which dreaming (qv) is abnormal, and as we are all liable, though in varying degree, to dreams, so are all normal minds liable to hypnotization. The

strong-minded person who declares that So-and-so tried to hypnotize him, but could not on account of his vigorous resistance, makes a ludicrous misstatement. It is not So-and-so who is to hypnotize him, but he himself, and incapacity for hypnosis is not the mark of a strong, but of a weak mind. Hypnosis (and this is a difference between it and dreaming) is impossible in the case of idiots and of very young children, because they are scatter-brained, unable to attend fixedly and continuously, the more "powerful the will," the easier must hypnosis be. We see this, indeed, in the tendency of vigorous minds to "brown study," a state nearly related to hypnosis, and characterized by the same single-hearted absorption and the same arrest of bodily movement. Whether or not animals can be hypnotized is a disputed question. In the emotion of extreme fear (when, if ever, the animal mind must be dominated by one sole idea, and so approach to the requisite degree of passive attention), we have a muscular rigidity, known as "catalepsy" (cf. the popular word "stroke"), which outwardly resembles the stage of catalepsy in man. Seize a frog firmly by a hind leg, and the animal will spread out, stiff and stark, making no effort to escape. Pigeons, fowls, guinea pigs, etc., can all be readily "hypnotized" by similar means. The trend of expert opinion seems, however, to be that the resemblance to hypnosis is rather external than real.

We turn now to some special questions of hypnosis, and first (1) to that of the *rapport*. This is a supposed subjective link or bond whereby the experimenter, in virtue of his will power or personal magnetism, attaches the subject to himself. Now it is true that there are cases in which a subject can be "hypnotized" only if a certain operator or experimenter allows or commands it. But there is nothing mysterious, still less supernatural, in the matter. The subject in some way (perhaps by self-suggestion, perhaps at the explicit suggestion of a physician) acquires the insistent belief that hypnosis is impossible for him without the presence or assent of the experimenter, and the belief, once acquired, is effective. It is thus the subject, again, whose "will" is concerned, not the operator. The *rapport* is sometimes suggested by physician to patient, in order to prevent interference by outsiders with the conduct of a case, and thus serves a useful purpose. 2. It may be suggested to a somnambulistic subject that at such-and-such a time after waking from the hypnotic sleep he shall perform such-and-such an action. This is termed *posthypnotic* or *terminal* suggestion. Its effectiveness depends upon the fact that the time idea is common both to the hypnotic and to the waking consciousnesses and so forms a bridge between the abnormal and the normal states. "You will go into the kitchen and drink a glass of water at five o'clock." The subject is strongly impressed by the five-o'clock idea. When, therefore, five o'clock actually comes, its perception or idea is sufficient to throw him into the first stage of hypnosis, the suggestion recovers its hypnotic strength, and he goes passively to execute the prescribed act. 3. Although the somnambulist remembers nothing of the hypnotic state from which he is aroused, he may, if rehypnotized, recall what took place during his previous sleep. Memory is thus continued from one hypnotic consciousness to another, as it is from one

waking consciousness to another, but there is no continuity of memory from sleep to waking, or conversely. This fact has given occasion to various theories of double consciousness (qv) —quite unnecessarily, for it is adequately explained by the known laws of memory. We remember only when we have a cue to memory, when our present circumstances "suggest" the past. When eating a good dinner after a long walk, we recall other good dinners eaten in like circumstances; we do not recall such dinners when there is nothing to remind us of them. But the waking state, with all the sudden inrush of stimulations that it involves, is entirely different from the hypnotic state, there is nothing in the one (apart from the terminal suggestions just discussed) to remind us of the other, whereas there is everything in a present hypnotic state to revive our memories of foregone like states. Dreams, in the same way, are not seldom continued from night to night, though we forget all about them in the daytime. 4 Lastly, as regards the *therapeutic value* of hypnosis, we may say that as a "suggestion," in the waking life, may make us blush or cry, so the indefinitely stronger suggestions of the hypnotic state may bring about circulatory or secretory changes that are of benefit to the organism. Furthermore, hypnosis is frequently used by psychopathologists, in the treatment of hysteria and other neuropsychoses, to bring about a recall and consequent discharge of the forgotten complexes which are supposed to be responsible for the disorder (see HYSTERIA). But no command to get well can ever mend a broken bone or cure a typhoid patient. Moreover, there is always the danger of setting up an "hypnotic habit" or of breaking down the subject's self-reliance, in which event the remedy is worse than the disease. See FAITH CURE.

Bibliography. For Charcot's standpoint, consult Binet and Féré, *Animal Magnetism* (trans., New York, 1888), Janet, *L'Automatisme psychologique* (Paris, 1889), Charcot, *Œuvres complètes*, vol ix (ib, 1893). For the Nancy standpoint, Bernheim, *Suggestive Therapeutics* (trans., New York, 1899), *Études nouvelles sur l'hypnotisme* (Paris, 1891), Moll, *Hypnotism* (trans., New York, 1893). Also in general, James, *Principles of Psychology*, vol ii (ib, 1890), Lehmann, *Die Hypnose* (Leipzig, 1890), Dessaur, *Bibliographie des modernen Hypnotismus* (Berlin, 1891), Jastrow, *Fact and Fable in Psychology* (Boston, 1900), Wundt, *Hypnotismus und Suggestion* (Leipzig, 1911), Prince, *The Unconscious* (New York, 1914).

HYPOBOLE, hī-pōb'ō-lē (Gk ὑποβολή, a throwing under, from ὑπό, *hypo*, under + βάλλειν, *ballein*, to throw). A figure of rhetoric, whereby each of several arguments that appeal to favor the side of ones opponent is introduced only to be refuted. See RHETORIC, FIGURES OF.

HYP'OCAUST (Lat *hypocaustum*, *hypocaustum*, from Gk. ὑπόκαυστον, vaulted room with furnace below, from ὑπό, *hypo*, under + καυστός, *kautos*, burned, from καίειν, *kainein*, to burn). An arrangement of hollow flooring for the distribution of heat in Roman houses and baths. Upon a lower flooring of concrete short brick pillars (*suspensurae*), about 2 feet apart in each direction, supported the large tiles of the upper flooring. Into the hollow space thus provided hot air from the furnace was discharged, and the smoke was led through passages partitioned

in the same space. The system was universal in the *thermae*, or baths, and sometimes in large houses, as in that of the Vestal Virgins at Rome. It was invented shortly before Augustus and is now coming again into use for heating the so-called "Turkish baths." It was an effective and agreeable mode of heating, but—except in baths, where the furnace was used to heat the water—enormously costly in fuel. It can be studied in all the details of its arrangement in the ruins of Roman houses and baths. See BATH.

HYPOCHLO'RITES. See HYPOCHLOROUS ACID.

HYPOCHLO'ROUS ACID, HClO. An acid that may be assumed to be formed when chlorine monoxide (Cl₂O) is dissolved in water. Chlorine monoxide, which decomposes into chlorine and oxygen with explosive violence, may be obtained by the action of dry red oxide of mercury upon chlorine. In aqueous solution chlorine monoxide is not explosive. The salts of hypochlorous acid are termed *hypochlorites*, and some of them are valuable bleaching agents. Ordinary bleaching powder is supposed to contain the hypochlorite of calcium, Javelle water contains the hypochlorite of potassium, Labarraque's solution contains the hypochlorite of sodium. Bleaching powder is made by the action of chlorine on lime, similarly the hypochlorite of potassium may be obtained by the action of chlorine upon a cold solution of caustic potash. If solutions of hypochlorites are heated, the corresponding *chlorides* and *chlorates* are formed. See BLEACHING POWDER.

HYPOCHÆRIS, hī-pō-kē'ris (Neo-Lat., from Gk ὑποχέρως, succory plant). A genus of plants of the family Compositæ, of which one species, *Hypochaeris radicata*, or long-rooted cat's-ear, is extremely common in meadows and pastures in Great Britain and other parts of Europe and introduced in the eastern part of the United States. Its leaves, which are all radical and spread on the ground, resemble in form those of the dandelion, but are rough, the stem is branched, the flowers somewhat similar to those of the dandelion, but smaller. Cattle eat this plant readily, and its abundance is not deemed injurious to pasture or fodder.

HYPOCHONDRIA, hī-pō-kōn'drī-a. See HYPOCHONDRIASIS.

HYPOCHONDRI'ASIS (Neo-Lat., from Lat *hypochondrium*, Gk ὑποχόνδριον, hypochondriac region, so called because of the supposed connection of the disease with this part of the body). A disease characterized by extreme increase of sensibility, palpitations, morbid feelings that simulate the greater part of diseases, exaggerated uneasiness, and anxiety, chiefly in what concerns the health, etc. In extreme cases it becomes a species of insanity. The disease is very frequently associated with disorder of the digestive functions.

When sombreness of disposition and anxiety concerning personal comfort become exaggerated, and attention is directed chiefly to the state of the health, it amounts to common hypochondriasis. When it passes beyond the control of the will, when the whole mind is directed to the state of the system or to particular organs and exalts and misinterprets sensations, the condition is designated hypochondriacal insanity. The disease may be described as the engrossment of the attention by false impressions conveyed, or conceived to be conveyed, from

internal organs These sensations may in many instances be real, and proceed from actual alterations in the structure or functions of the parts supposed to be affected, but they may likewise consist of ordinary sensations, excited and intensified by the act of attention which makes them known to the patient. Neither the experience nor the sufferings of the victims are imaginary, however absurd their errors, and however groundless their apprehensions may be the disease is real, and consists in the exaltation of sensibility and attention and in the delusions which originate in that morbid state. A man lives in constant fear of death, he is firmly convinced that he labors under cancer, consumption, disease of the heart, etc. Hypochondriasis is often a precursor of melancholia, or other kinds of alienation, but it must likewise be regarded as a distinct and independent affection, traceable generally to disorder of the digestive and assimilative apparatus, to sexual excess or other debilitating influences. Such patients always should be watched, for many of them commit suicide while temporarily under the influence of an hallucination or a delusion. Diversion, camp life, hunting, fishing, and other occupations should engross the patient's attention during an outdoor life, or travel should be his resource, always in the society of a lively, healthy companion. Drugs alone produce little benefit. Consult Falret, *De l'hypochondrie et du suicide* (Paris, 1822), Bucknill and Tuke, *Psychological Medicine* (London, 1879), C. A. Mercier, *Psychology, Normal and Morbid* (New York, 1902), Boris Sidis, *The Foundations of Normal and Abnormal Psychology* (Boston, 1914).

HYPOCOTYL (abbreviation of *hypocotyledonous*, from Gk *ὑπό*, *hypo*, under + *κοτυληδών*, *kotylēdōn*, cotyledon, from *κοτύλη*, *kotylē*, socket). In seed plants, the axis of the embryo below the cotyledons. This axis has been variously called radicle and caulicle, but, since it has peculiar structures and powers which do not belong to ordinary roots and stems, it has received a distinctive name. In general, the hypocotyl is the most active organ of the embryo, by its growth liberating the embryo from the seed and putting root and shoot into their proper relations. In other words, it is the organ of the embryo that orients the young plant for its independent existence. This was the basis for Darwin's remark that if a seed plant can be imagined to have a brain it would be found in the hypocotyl. See **EMBRYO**.

HYPOCRITE, THE. A play by Isaac Bickerstaffe, produced in 1768, and founded on Cibber's *Non-Juror*, which, in turn, was taken from the *Tartuffe* of Molière.

HYPOCYCLOID See **CYCLOID**.

HYPODERMIC MEDICATION (from Gk *ὑπό*, *hypo*, under + *δέρμα*, *derma*, skin). Introduction of medicines beneath the skin with a hypodermic syringe. This method is often preferable to that of giving them by the mouth, particularly when a rapid result is essential. The stomach is sometimes in a condition which will not bear the presence of drugs, particularly narcotics, and these are the agents which are most frequently administered hypodermically. A small graduated glass syringe attached to a slender hollow needle, cut off obliquely so that its sharpened extremity may easily be made to pierce the skin, is used. The medicine may be thrown in just beneath the skin, or the point of the sy-

ringe is thrust into the body of a muscle. The wounding of blood vessels or nerves should be carefully avoided, and therefore the operator should not be undertaken except by a physician or a trained nurse. Local pains may generally be more successfully treated in this manner than by the common method. In some cases an anæsthetic may, however, be preferable. It is usual to make a special preparation of the drug which is to be introduced. The syringe must be completely filled when used, as the introduction of an air bubble into a vein might be attended with danger. All instruments and drugs used should be thoroughly sterilized, and the skin over the point of puncture cleansed with an antiseptic. The hypodermic syringe should be used with great caution and never by the patient.

HYPODERMIS (Neo-Lat., from Gk *ὑπο*, *hypo*, under + *δέρμα*, *derma*, skin). In plants, a layer of cells beneath the epidermis. An archesporial cell is said to be hypodermal in origin when it arises immediately beneath the epidermis. Tissues bordering directly upon the epidermis are called *hypodermal*.

HYPODERMOCLYSIS (Neo-Lat., from Gk *ὑπό*, *hypo*, under + *δέρμα*, *derma*, skin + *κλύσις*, *klysis*, a washing). The infusion of saline solution beneath the skin. The term is sometimes used to cover intravenous infusion also. The infusion of saline solution has to a large extent replaced the older operation of blood transfusion, being safer, always available, and obviating the difficulty of obtaining a suitable donor of blood.

Solutions of sodium chloride containing 0.65 to 0.75 per cent of that salt preserve and do not disintegrate the blood corpuscles. The total percentage of saline and alkaline constituents in human blood are variously given by different observers and probably vary in different individuals and under different conditions of the body. A formula which will reproduce exactly the chemical composition and specific gravity of the inorganic portion of the blood serum is not practicable, but the following "artificial serum" answers all purposes.

Sodium chloride	50 grains
Potassium chloride	2 "
Sodium sulphate	} each
Sodium carbonate	
Sodium phosphate	
Boiling water	1 pint

Such a solution may be introduced into a vein or injected slowly under the skin, at a temperature of 100° F., or it may be introduced into the lower bowel (*enteroclysis*). The injection of saline solution is employed in hemorrhage, shock, typhoid fever, cholera, and in septic conditions generally. In hemorrhage it acts mechanically by filling the vessels and raising the blood pressure. In shock and collapse it serves as a stimulant, and in toxæmias it acts as an eliminant as well. From a half pint to a quart of solution is used for each injection. See **TRANSFUSION OF BLOOD**.

HYPOGYNY, *hi-pōj'i-ni* (from Gk *ὑπό*, *hypo*, under + *γυνή*, *gynē*, woman). The condition in a flower in which the sepals, petals, and stamens arise from beneath the ovary. As a consequence, the ovary is seen inside of the flower and is often spoken of as "superior." The contrasting term is "epigyny" (q.v.). Hypogynous flowers are more primitive than epigynous flowers. The primitive Angiosperms all

have hypogynous flowers, which in turn have arisen from the conelike clusters of the Pteridophytes and Gymnosperms, while all of the three great divisions of Angiosperms (Aichichlamydeæ, Sympetaleæ, and Monocotyledons) culminate in families with epigynous flowers. It is quite evident, therefore, that one of the strongest evolutionary tendencies among Angiosperms is to pass from hypogyny to epigyny. See FLOWER, EPIGYNY, PERIGYNY.

HYPONASTY (from Gk *ὑπό*, *hypo*, under + *ναστός*, *nastos*, close-pressed, from *νάσσειν*, *nassein*, to pack closely). In botany, a term applied by De Vries to the occurrence of greater growth upon the underside of a dorsiventral organ, which produces therefore an upward curvature. This may be due to internal or external causes. It is the common condition of young leaves and flower parts when in the bud. The correlative term is "epinasty" (q v). See GROWTH, IN PLANTS.

HYPONITRITES. See HYPONITROUS ACID.

HYPONITROUS ACID, $\text{H}_2\text{N}_2\text{O}_2$. A dibasic acid composed of hydrogen, nitrogen, and oxygen, which has been isolated in the form of a crystalline solid substance. It is very soluble in water and is violently explosive. Its salts are termed *hyponitrites*, and the free acid itself is best prepared from the hyponitrite of silver by the action of a solution of hydrochloric acid gas in ether. Silver hyponitrite, $\text{Ag}_2\text{N}_2\text{O}_2$, is a solid yellow substance that may be obtained by allowing sodium amalgam to act upon barium nitrite, neutralizing the resulting solution with acetic acid and precipitating with silver nitrate. Silver hyponitrite explodes if heated to a moderately high temperature. The solution of free hyponitrous acid decomposes, on heating, into nitrous oxide (laughing gas) and water.

HYPONOME. See CEPHALOPODA.

HYPOPHOSPHITES. See HYPOPHOSPHOROUS ACID.

HYPOPHOSPHOROUS ACID, H_3PO_2 . A crystalline compound that melts at about 17.5°C (63.5°F) and is readily transformed into ordinary phosphoric acid. It may be obtained by boiling caustic potash with phosphorus, subsequently adding sulphuric acid, concentrating the solution by evaporation, and allowing it to crystallize in the cold. The salts of hypophosphorous acid are termed *hypophosphites*, those of iron, calcium, sodium, and potassium being extensively used in medicine, and often forming ingredients of patent medicines which are claimed to be valuable remedies for tuberculosis. Most such preparations are worthless, being mixtures of the hypophosphites of two or more metals, the several ingredients of which may counteract one another, and some such mixtures are positively harmful. On the other hand, if prescribed separately in moderate doses by a competent physician, the hypophosphites often constitute valuable therapeutic agents, inasmuch as they have the effect of improving nutrition and relieving some of the symptoms of phthisis. The hypophosphite of potassium may be used as an expectorant in chronic bronchitis. The official sirup of hypophosphites contains several hypophosphites, a considerable amount of free hypophosphorous acid, and often some iron.

HYPOPHYESIS. A term used in dicotyledonous plants to designate the cell of the proembryo which completes the hypocotyl tip of the embryo. It is the appearance of the hypophy-

sis that finally differentiates the proembryo into embryo and suspensor.

HYPOSTASIS (Neo-Lat., from Gk *ὑπόστασις*, *hypostasis*, subsistence, from *ὑπόστατος*, *hypostatōtos*, substantial, from *ὑπαστάειν*, *hyphestanai*, to stand under, from *ὑπό*, *hypo*, under + *ιστάειν*, *istanai*, to stand). A term of Greek theology, denoting reality as distinguished from appearance and variously employed before the fourth century, but at last technically used to denote personal distinctions in the Godhead. The Council of Nicæa (325) did not clearly distinguish between *hypostasis* and *ousia* (substance and essence), and a controversy followed (See HOMOOUSION). The same uncertainty appears in the West as late as Augustine, who confesses that he does not understand the difference between the two Greek words (*De Trinitate*, v, 8, 10). But gradually the two words were differentiated, and *hypostasis* came to be used exclusively for the personality of Father, Son, or Holy Spirit. It was thus interpreted as being equivalent to *prosopon*, which the Latin rendered by *persona*, whence our word "person," applied to the Trinity. The fully developed trinitarian dogma asserts one essence, or substance (*ousia*), and three persons (*hypostasis*) in the Godhead. This has remained the orthodox doctrine of the Church. Consult Friedrich Loofs (Halle, 1893), G. P. Fisher (New York, 1896), Adolf Harnack, *History of Dogma*, vol. iv (Boston, 1899), J. Tixeront, *History of Dogmas* (3 vols., St. Louis, 1910), A. L. Graebner, *Outlines of Doctrinal Theology* (2d ed., ib., 1911), T. von Haering, *History of Dogma* (New York, 1911). See CHRISTOLOGY, TRINITY, DOCTRINE OF THE

HYPOSTATIC UNION. A term used to describe the union of Christ's human nature to the hypostasis or person of God the Word, in virtue whereof, while each nature is complete even after union, yet there is but one undivided person of the God-man, to which all the actions, whether divine or human, are ascribed. This form of expression was devised for the purpose of excluding the doctrine of a mere moral union held by Nestorius. See CHRISTOLOGY, MONOPHYTES, NESTORIANS, TRINITY, DOCTRINE OF THE

HYPOSULPHITES. See THIOSULPHURIC ACID.

HYPOTENUSE (Fr. *hypoténuse*, from Gk *ὑποτενύουσα*, *hypotenousa*, subtending, from *ὑποτείνειν*, *hypotenain*, to subextend, from *ὑπό*, *hypo*, under + *τείνειν*, *teinon*, to stretch). That side of a right-angled triangle opposite to the right angle. The hypotenuse is the longest side of the triangle, and its mid-point is the centre of the circumscribed circle. According to the famous forty-seventh proposition of the first book of Euclid's *Elements*, the square of the hypotenuse of a right-angled triangle equals the sum of the squares on the other two sides. The proof of this proposition is attributed to Pythagoras, although the fact was known in Egypt, and probably in China and elsewhere, long before the time of this philosopher.

HYPOTHEC, **HYPOTHECATION** (ML. *hypothecatio*, from *hypotheca*, to hypothecate, from Lat. *hypotheca*, from Gk *ὑποθήκη*, *hypothēkē*, pledge, from *ὑποτίθεσθαι*, *hypotithenai*, to place under, from *ὑπό*, *hypo*, under + *τίθεσθαι*, *tithenai*, to place). A lien on property created by agreement or by operation of law. In the most general sense a transaction whereby property, real or personal, is subjected to the claim of another. "Hypothecation" is not a term of

English or American law, but the verb "hypothe-
cate" is sometimes popularly employed as the
equivalent of "pledge." At Roman law hypothec
was the right to take and sell property belong-
ing to another to satisfy a claim. Any balance
remaining after a creditor's claim was satisfied
was restored to the former owner of the prop-
erty. Hypothec might be established by the act
of the owner (English mortgage), or it might
be created by law (English lien). In either
case the hypothecation might be of real property
or of personal property, or of both. Many of
the legal liens extended over the debtor's entire
estate, real and personal. Hypothec was dis-
tinguished from pignus, or pledge, in that it
was established without delivery of possession.
In modern civil law the term "hypothec" is
commonly restricted to the mortgage or lien
upon real property. At French law a lien upon
movables or upon an entire estate is termed a
"privilege," the term "hypothèque" being con-
fined to the mortgage of real estate. In Spanish
law the term is restricted to the contractual
mortgage of real property, all legal liens,
whether upon realty or personalty, are "prefer-
ences." In Scotland, however, a legal lien upon
personal property is called a hypothec. See
LIEN, MORTGAGE, PLEDGE, and consult the au-
thorities referred to under REAL PROPERTY.

HYPOTHENUSE See HYPOTENUSE

HYPOTHESIS (Gk *ὑπόθεσις*, supposition,
from *ὑποτίθεμαι*, *hypotithenai*, to place under,
from *ὑπό*, *hypo*, under + *τίθεμαι*, *tithenai*, to
place). In scientific procedure, a conjecture as
to the explanation of any phenomenon, made
provisionally and used as a starting point for
further investigation and theory. Thus, in
studying the motion of the moon, Newton made
the hypothesis that its divergence from the
straight line was due to the same cause that
brings an apple to the ground when released
from the stem. He then proceeded to find
whether the rate of fall in the two cases was
expressible by some single formula. After years
it was discovered that this was the case. It
is now quite generally admitted that an hypothe-
sis, to have any value, should be based on some
known law and should be the conjectural ex-
tension of that law to a new sphere under
investigation. Thus, Newton worked from the
known law of gravitation on the surface of the
earth. The hypothesis of a luminiferous ether
is based on the known laws of the motion of
fluids, etc. Such a known law is called a *vera*
causa. Some empirical extremists insist not
only that the point of departure must be a
known law, but that the extension of this law
to another sphere may not be legitimately made
unless its extension is at least conceivably ver-
ifiable by sense perception. Thus, they claim
that the existence of the luminiferous ether is
not a rigidly logical hypothesis, because the
ether is thought of as having no properties per-
ceivable by our senses without the use of instru-
ments that no one even supposes capable of
construction. Such an interpretation of the
vera causa is, however, not in accordance with
actual scientific practice. An hypothesis is a
provisional attempt to *think* things together as
instances of the prevalence of the same law,
and all that is necessary to make an hypothesis
valuable is that it should furnish some con-
ception which shall at least provisionally unify
experience by reducing it to law. A distinction
is often made between theory and hypothesis

A theory is said to be a verified hypothesis.
This distinction is one of degree, not of kind.
Even an hypothesis which has been verified may
be overthrown by new facts, so that it is rather
the fashion nowadays to speak of all the con-
ceptions of natural science as "*working* hypothe-
ses," and to say that they are accepted only
tentatively as the basis for further investiga-
tions and for further theorizing on results. Ac-
cording to the pragmatistic logic (see PRAGMA-
TISM), all truth is nothing but successfully
working hypothesis. See KNOWLEDGE, THEORY
OF. For bibliography of the subject, see the
works cited in the article LOGIC.

For the use of this term in geometry, see
THEOREM.

HYPOTHETICAL QUESTION In the
law of evidence, the form of question through
which the opinion of an expert witness is
properly elicited. In order that the opinion of
such a witness shall be of any value to the
court or jury trying the case, it is obvious that
it must be based on the facts on which the
verdict is to be rendered, otherwise it would
be irrelevant and on that ground inadmissible.
On the other hand, it is not deemed proper to
ask an expert witness to give his opinion—as
of the mental soundness of a testator or the
sanity or insanity of a defendant in a criminal
case—on the evidence which has been adduced
in his hearing in the course of the trial. To do
this would be to require him to make a finding
on those facts, perhaps on conflicting or untrust-
worthy evidence, as a basis for his opinion, and
thus in effect, as it is sometimes expressed, to
usurp the functions of the jury in passing on
the evidence. It is simpler and less confusing
to get his opinion on an assumed set of facts.
This is the function of the hypothetical ques-
tion. Its value—or rather the value of the
opinion rendered—depends, of course, largely on
the closeness with which the assumed, or hypo-
thetical, facts embodied in the question conform
to the facts in evidence, or, better yet, to the
facts as they present themselves to the court
or jury with whom the decision of the case
rests. The use of the hypothetical question has
been much criticized, but this is due to the
abuse of a method which is commonly employed
in argument and reasoning, and which is prob-
ably indispensable, as it is valuable, in the
production of opinion evidence. See EVIDENCE,
OPINION.

HYPFOXANTHINE, *h'pō-zān'thīn* (from Gk.
ὑπόξανθος, *hypoxanthos*, yellowish brown, from
ὑπό, *hypo*, under + *ξανθος*, *wanthos*, yellow),
or SARCINE, $C_6H_7N_3O$. An organic substance
chemically allied to xanthine, which it usually
accompanies. It was discovered by Scherer in
1850. If given to birds, hypoxanthine is ex-
creted largely in the form of uric acid, it is not
known by what organ this transformation is
effected—probably not by the liver. Hypoxan-
thine is widely distributed in the animal and
vegetable kingdoms. It was synthesized by Emil
Fischer in 1897 and again, in a different way,
by Traube in 1904. It is a white crystalline
substance, slightly soluble in cold water, but
somewhat more readily soluble at higher tem-
peratures. See XANTHINE.

HYP'SILANTIS See YPSILANTIS

HYPSSIPYLE, *hip-sip'i-lē* (Lat., from Gk.
Ἑψιπύλη). The daughter of Thoas of Lemnos,
whom she saved when the women of the island
killed all the other men in revenge for their

neglect. When the Argonauts (qv) came to Lemnos, Hypsipyle became by Jason the mother of two sons, Euneus and Nebiophonos, or Thoas. Having been driven out because she had spared her father, Hypsipyle became the nurse of Opheltus, son of the Arcadian King Lycurgus. When Adrastus and the other heroes were on their way to the siege of Thebes, they met Hypsipyle in the Nemean Forest and begged her to show them a spring, and during her absence the boy was killed by a serpent. For this neglect she was imprisoned, but was rescued by her sons. The funeral games instituted by the heroes for the dead Opheltus were the origin of the Nemean Games. See NEMEA.

HYPSISTARIANS (from Gk. Ὑψιστάρηαι, *Hypsistarioi*, Hypsistarians, from ὕψιστος, *hypsistos*, most high, from ὑψι, *hyspi*, on high). A small sect which existed in the third and fourth centuries in Asia Minor. It seems to have been monotheistic and Jewish in some of its features, and in others possibly Christian, debased by Sabeian elements. It taught the unity of the Deity and His universal dominion, that sacrifices and other phenomena of external worship were to be given up; at the same time it enjoined Sabbath observance and the dietary laws of the Jews. The sect is described by Gregory of Nazianzus in his account of his father. Consult Cumont, *Hypsistos* (Brussels, 1897).

HYPSOMETER (from Gk. ὑψι, *hyspi*, on high + μέτρον, *metron*, measure), or **THERMOBAROMETER**. A name commonly applied to an apparatus arranged to determine the atmospheric pressure at a given point by ascertaining accurately with a thermometer the temperature at which water boils. The boiling point of water diminishes with a decrease in the pressure of the atmosphere, and this always comes with an increase in elevation above the sea level. With the barometer (qv) it is possible to measure heights with considerable exactness, consequently, by knowing the atmospheric pressure corresponding to the temperature at which water boils, we are able to find the altitude. The apparatus to determine the boiling point was first used by Wollaston in 1816 and consisted of a metal vessel containing a delicate and carefully tested thermometer with graduations extending from 80° to 100° C, which could be read to 0.01 of a degree. There is a spirit lamp to boil the water, and the instrument is far more portable than a mercurial barometer. The relation between the boiling point of water, the height of the barometer, and the altitude is shown in the following table, which is calculated for a mean temperature of the atmospheric mass in the vicinity of the point of observation.

Boiling point (Centigrade)	100°	99°	98°	97°	96°	95°	94°	93°	92°	91°	90°
Height of barometer (mm)	760	732.2	707.1	681.9	657.4	633.7	610.6	588.3	566.7	545.8	525
Elevation (in meters)	0	305	610	920	1225	1540	1850	2165	2485	2800	3120

From this table it will be seen that a variation of 0.1° in the boiling point at sea level corresponds to a decrease in the height of the barometer of 28 millimeters, at an elevation of 1000 meters 25 millimeters, at 2000 meters 22 millimeters, and at 3000 meters 21 millimeters. An approximate rule to determine the elevation of a place by this method, expressed in feet and Fahrenheit degrees, is to multiply the difference between the observed boiling point and 212° by

550 if the height is less than half a mile, and by 560 if it is in excess of that amount, these factors representing the average amount of altitude corresponding to 1° at 70° F.

Hypsometers of very accurate construction have been extensively observed with great care in long series of observations made aboard ship by Hecker, also under the direction of L. A. Bauer on board the magnetic yacht *Carnegie*, for the purpose of ascertaining the variations in the force of gravity at sea. As explained above, the pressure of the air is obtained from the readings of the hypsometer. Simultaneous readings of high-grade mercurial barometers should also give the same pressure, except that when all corrections are applied there will still be an outstanding difference between the two pressures thus obtained, because the mercurial barometer is influenced by the force of gravity, while the hypsometer is not. The variable outstanding differences found from point to point over the ocean therefore represent corresponding variations in the force of gravity. This is perhaps the only practicable method of measuring variations of gravity at sea, but the quantities desired are so small, compared with the unavoidable inaccuracies of the observations under even the most favorable circumstances, that entirely conclusive results are hardly attainable as yet. Consult Hecker, *Memoir of the Prussian Geodetic Institute* (1908), and Bauer, *American Journal of Science* (January, 1911, and March, 1912).

HYPSOMETRY. The art of measuring heights on the earth's surface. Such measurements are performed by means of trigonometrical observations and calculations, by running a line of precise levels starting from mean sea level and terminating at the point whose height is to be measured, and by barometric observa-

tions and calculations. The second of these methods of measurement gives exact heights, but the other two methods give approximate heights only. To illustrate the application of the three methods of measurement, a supposititious case will be assumed, and each method applied to its

solution. Let x represent the top of a mountain whose height above the base s it is desired to measure by trigonometrical observation, and whose distance m from the point of observation is known. The instrument is set up at y , and by it the vertical angle mx is measured. This gives the observer a triangle mxs , of which the side m , the angle mxs , and the angle msx (90°) are known, and from these data he can readily calculate the length of the side xs . To this

dimension in order to get the height of the mountain he must add the dimension 10 , which is the height of the instrument above the ground, and the dimension os , which is due to the curvature of the earth. The dimension 10 is easy to determine, but os has to be calculated. Now, the curvature of the earth is 0.667 foot, or nearly 8 inches in 1 mile, and increases as the square of the distance, being thus 32 inches in 2 miles and 72 in 3 miles. If then the distance m is 1 mile, the dimension os is 0.667 foot. Owing to the refraction of the atmosphere, however, the point x always appears to the observer to be higher than it really is, and at an average this deceptive elevation amounts to one-seventh of the curvature of the earth and, like the latter, varies with the square of the distance. For a distance m equal to 1 mile, then, the dimension os is 0.667 foot due to curvature minus one-seventh of 0.667 foot due to refraction, which makes it 0.5714 foot. In careful geodetic work the calculations for refractions and curvature are made with much more precision than is done above, and the instrument observations are made with exceeding care, but the general method is the same. At best such measurements are only approximate, since the determination of the refractions, which depends upon the atmospheric conditions, can be approximate only. To measure the height xs by leveling, the observer starts from mean sea level and runs a line of precise levels inland, which terminates at the point x and establishes accurately its height above mean sea level. The same result may be accomplished by starting the line of levels to x from a point on a line of levels previously run from mean sea level. The method of running precise levels differs from ordinary spirit leveling (see LEVELING) only in the greater accuracy of the methods and instruments used.

For measuring heights approximately by barometric observations, the aneroid barometer is usually used. Mercury barometers are more accurate and may of course be used, but usually they are not, owing to the greater difficulty in transporting them and of keeping them in proper working order. The adaptability of the barometer as an instrument for measuring heights depends upon the facts that the mercury column falls as the atmospheric pressure decreases, and that the atmospheric pressure decreases gradually as we ascend above the sea level. As a rough average, it may be assumed that the barometer falls $1/10$ inch for about 106 feet rise. To measure the height xs , therefore, according to Laplace's formula barometer readings are taken simultaneously at s and at x , and from them the difference in height of s and x may be found by the formula

$$d = 60,158.6 (\log H - \log h) \left(1 + \frac{T + t - 64}{900} \right),$$

in which d equals the difference in height in feet, H and h are the two barometric readings in inches of the lower and upper stations, and T and t are the temperatures of the corresponding stations in degrees Fahrenheit. In the most accurate barometric work various refinements of observation and calculation are introduced, but the general principle of the operation is the same as has been described. Barometrical measurements of heights are only approximate, since the moisture and dryness of the air, the wind, and various other atmospheric phenomena cause variations in the readings recorded, and no comprehensive formula can possibly be devised. Sim-

ultaneous observations, with barometers adjusted to the same standard, give the most reliable results.

By using a finely graduated thermometer to determine the boiling point of water it is also possible to determine the pressure and thereby the altitude, this method being used by mountain climbers, as the apparatus, which consists of a thermometer, spirit lamp, and vessel to contain snow or ice, is very portable. An approximate rule is, calling the boiling point at sea level 212° F, to allow 511 feet for the first degree of difference and increase the number to be added 2 feet for each degree. Thus,

ELEVATION	BOILING POINT
0 feet	212°
511	211
$511 + 513 = 1024$	210
$1024 + 515 = 1539$	209, etc

Geographer's tables of corresponding heights have been worked out in considerable detail, as in the *Smithsonian Miscellaneous Collection* (Washington). For a full discussion of the methods of measuring heights by trigonometrical leveling, precise leveling, and barometric observations, consult Johnson, *Theory and Practice of Surveying* (17th ed., rewritten by L. S. Smith, New York, 1913). See SURVEYING, HYPSONOMETER.

HYRACEUM (Neo-Lat., from Gk *ὑραξ*, *hyrax*, mouse, connected with Lat *scoræ*, shrew-mouse). A peculiar substance found in the crevices of the rocks of Table Mountain, Cape of Good Hope. It is one or more of the excrements of the Cape hyrax (*Hyrax capensis*). Hyraceum is a blackish-brown viscid material, not unlike soft pitch, having a strong and offensive taste, not unlike castoreum, for which it has been used as a substitute in medicine, though now obsolete. At one time so large a quantity was found as to suggest the idea of its being used as a manure, but the supply was soon exhausted.

HYRACODON (Neo-Lat., from Gk *ὑραξ*, *hyrax*, mouse + *ὀδούς*, *odontis*, tooth). A primitive fossil rhinoceros found in the Miocene rocks of western America and Europe. See RHINOCEROS.

HYRACOTHERIUM (Neo-Lat., from Gk *ὑραξ*, *hyrax*, mouse + *θηρίον*, *thērion*, dim of *θήρ*, *thēr*, wild beast). An extinct four-toed ungulate mammal of the size of a fox, generally considered as an ancestral horse, remains of which are found in the Lower Eocene deposits of Europe and western North America. See HORSE, FOSSIL.

HYRAX (Neo-Lat., from Gk *ὑραξ*, mouse). A general name for a suborder (Hyracoidea) of small, peculiar, ungulate mammals comprised in a single genus and family (*Procavia*, *Procaviidae*), whose species are locally called conies, damans, and rock rabbits. Numerous species and subspecies are known in southwestern Asia and in East and South Africa. Although having the size and superficial appearance of rodents, and long so considered, Cuvier pointed out their essential agreement, in dentition and anatomical characters, with the ungulates. The molars are quite similar to those of the rhinoceros but the upper jaw has two incisors curving downward and during youth two very small canines, the lower jaw four incisors without canines. The skull, also, and other bones resemble those of the rhinoceros. The muzzle is short and pointed, the ears short and round. The

ribs are more numerous than even in the rhinoceros—21 pairs, a number exceeded in no quadrupeds except the sloths, whereas no rodent has more than 15 pairs. The toes are united by the skin, as in the elephant and rhinoceros, and are round and soft, merely protected in front by a broad nail, which does not reach the ground. The legs are short. The tail is a mere tubercle. Their bodies are clothed with thick, uniformly dark brown hair, except that it is discolored around a curious gland near the middle of the back, which is naked in several species.

The habits of all the conies (except the tree hyraxes) are much alike. The typical Abyssinian species live in rocky or stony places, in communities, like rabbits, and make their homes in holes under rocks or in a rocky watercourse. They seem to be mainly nocturnal and feed at night or in the early morning on leaves and young shoots of trees and bushes. In daytime they lie on rocks in the shade until towards noon, when they are likely to retire to their holes. They are very timid and disappear when they are in the least danger. The only sound they seem to make is a shrill squeak when suddenly alarmed. This description will remind the reader of the closely similar behavior of the pikas (q v) of the Rocky Mountains, often called conies. Mosely speaks of "a short, hissing noise" as the alarm cry of the Cape hyrax. All climb about smooth rocks with wonderful agility, which is explained by soft, almost suction-giving pads on the soles of their feet. (Consult Schweinfurth, *Heart of Africa*, vol. 1, Leipzig, 1878.) The species longest known is the only Asiatic one (*Procavia syrica*), which inhabits Arabia, Syria, and Palestine, and is the animal called cony in the ordinary version of the Bible, for which the Syrian name is daman. It was among those animals prohibited to the Israelites under the mistaken belief that they chewed the cud, but they are now eaten by the Arabs, though not regarded as very palatable by Europeans. Several species inhabit Abyssinia and East Africa, down to Mozambique, and Cape Colony and Natal are the home of a kind (*Procavia capensis*) having very fine, soft, brown fur, with the spot on the back black, which is familiar to the English colonists under the names rock badger and rock rabbit and to the Dutch as dassie. They are often tamed as pets.

Three species of the genus *Dendrohyrax*, which live in East and West Equatorial Africa, differ decidedly from other conies by the habit of spending their lives and making their breeding nests in holes in trees. These three species agree in that the females have but a single pair of teats (other hyraxes have three pairs), and the West Coast one is remarkably large and furry, so that its skin is of much value as material for cloaks.

Consult, for systematic revision of the order, Thomas, "On the Species of the Hyracoidea," in *Proceedings of the Zoological Society of London* (London, 1892), and Sclater, *The Mammals of South Africa*, 1 (ib, 1900).

HYRCANIA (Lat, from Gk Ὑρκανία, *Hyrkama*). An ancient district of Asia, south of the Caspian Sea (anciently called Hyrcanum Mare), bounded on the southeast by the Sariphi Mountains (now Elburz), which separated it from Parthia proper, and on the west by Media. It corresponded to the modern Mazanderan and Astrabad. The district is called Vehrkanā in the *Avesta*, a name which recalls the ancient

name for wolf (*vahika*). The region was wild and heavily wooded, and not generally fertile, with the exception of the valleys among the hills, which produced corn, oil, and wine. The river Gurgan, or Jurjan, an affluent of the Caspian Sea, has preserved the name of the ancient province.

HYRCANUS (Lat, from Gk Ὑρκανός, *Hyrkanos*). The name of two Jewish high priests and princes of the Hasmonæan family. 1 JOHN (Heb, Johanan) HYRCANUS, son of Simon, was, during the lifetime of his father, Governor of the seacoast, with his seat in Gazara, and defeated Cendebeus, the Syrian general. When Simon was murdered by his brother-in-law, Ptolemy, an attempt was made also on Hyrcanus, but he escaped and obtained control of Judæa (135 B C). At the beginning of his reign Antiochus VII Sidetes invaded the country, and Hyrcanus was compelled to sue for peace after having been shut up in Jerusalem. Antiochus showed himself inclined to be sparing, and Jerusalem escaped destruction. In 130-129 B C Hyrcanus assisted Antiochus in a campaign against his brother, Demetrius Nicator, in which, however, Antiochus lost his life. Demetrius' short reign marked a period of internal dissensions in Syria, which enabled Hyrcanus to establish the independence of Judæa. In this his alliance with Rome was of material help. After the fall of Demetrius and his rival Alexander Zabina, Hyrcanus began (c 123 B C) the conquest of troublesome neighbors. First attacking Medaba in the Jordan district, he marched towards Shechem and succeeded in destroying the Samaritan temple on Mount Gerizim (c 120 B C), though the Samaritans were not brought to submission till c 109 B C. Next the Idumæans were conquered and compelled to accept the Jewish faith. Even the trans-Jordanic peoples felt the power of Hyrcanus. Coins were minted with the inscription "Johanan High Priest and Chief of the Commonwealth of the Jews." Like the rulers of his family before him, Hyrcanus was a Pharisee, but because of an aspersion cast upon his mother, who had been a prisoner of war, he became a Sadducee, and the latter part of his reign was involved in this factional difficulty. He died in 104 B C and left five sons—Aristobulus, Antigonus, Alexander, Absalom, and another whose name is not known—two of whom, Aristobulus I and Alexander Jannæus, governed with the title of King. It has been suggested by Adolphe Reinach (*Revue des études juives*, lxxv, p. 303, Paris, 1914) that he may have received the surname as a consequence of his participation in the expedition of Antiochus VII Sidetes into Hyrcania. 2 HYRCANUS II, son of Alexander Jannæus and grandson of the preceding. On the death of his father, in 76 B C, he was appointed high priest by his mother, Salome Alexandra, who ruled Judæa herself for several years. After her death (67 B C), he became temporal ruler also, but his younger brother, Aristobulus, an abler and more energetic man, seized the government and forced Hyrcanus to make an agreement by which Aristobulus was to rule and Hyrcanus to be only high priest. Induced by the Idumæan Antipater, he broke this agreement, and, aided by Aretas, King of Arabia Petræa, he endeavored to win back his dominions. Scaurus, the legate of Pompey, was bribed by Aristobulus, and Aretas had to abandon the siege of Jerusalem. By counter bribery on the part of Antipater, Hyrcanus obtained the

control Pompey took away the kingship from Hyrcanus, leaving him high priest, and proclaimed Antipater Governor of the country in 63 B.C. Aristobulus and his two sons, who had been carried away captives, tried at different times to wrest the power from Antipater, but failed. Finally, in 47 B.C., Cæsar made Hyrcanus tetrarch and high priest, and Antipater was made procurator. Those around Hyrcanus and Hyrcanus himself began to suspect Antipater, and, while banqueting with Hyrcanus, Antipater was poisoned (43 B.C.), though Hyrcanus was not involved in this act. In 40 B.C. Antigonos, son of Aristobulus II, with the help of the Parthians, invaded the land, captured Hyrcanus by treachery, cut off his ears and thus disqualified him for the office of high priest, and carried him off to Seleucia on the Tigris. Some years later Herod, son of Antipater, obtained supreme power in Judæa and invited the aged Hyrcanus home to Jerusalem. For some time he lived in ease and comfort, but, falling under suspicion of the intrigues against Herod, was put to death (30 B.C.). Consult Gratz, *Geschichte der Juden*, vol. II (Berlin, 1854-75), Schurer, *Geschichte des jüdischen Volkes*, I (4th ed., Leipzig, 1901), Bevan, *The House of Seleucus* (London, 1902), Bouché-Léclercq, *Histoire des Séleucides* (Paris, 1913), Wellhausen, *Israelitische und jüdische Geschichte* (7th ed., Berlin, 1914).

HYRIEUS, hi-rî'ë-üs or hi-rî'ûs (Lat., from Gk. Ἥριος, *Hyrieus*, Ὀυριεύς, *Ourieus*). Son of Poseidon and King of Hyria in Boeotia, for whom Agamedes and Trophonius built a treasure house. In this, one stone was so arranged that it could be removed from the outside, thus enabling them to plunder the treasury at will. When Agamedes was finally caught in a trap set by the King, Trophonius cut off his brother's head to prevent discovery and fled to Lebadea, where he was swallowed up by the earth. (See **TROPHONIUS**). The story is told also of Rhampsinitus, a king in Egypt, by Herodotus (II, 121) and is found as a folk tale in many lands and in many variations.

HYRTL, hîr'tl, JOSEPH (1810-94). An Austrian anatomist, born in Eisenstadt in Hungary. He was educated at the University of Vienna, where he became prosecutor in 1833. He became professor of anatomy at Prague in 1837 and filled a similar position at Vienna from 1845 to 1874. His last years were spent in retirement and almost total blindness. Hyrtl endowed several charities in Vienna and elsewhere, especially orphan asylums and nurseries. His high rank in the scientific world was recognized before his death by the erection of a colossal marble statue in the arcade of the University of Vienna (1889). His researches dealt with comparative anatomy, especially that of fishes, the construction of the ear and of the testicles, and, above all, with the subject of angiology, in which his great discoveries were made. Besides monographs on such subjects, including *Untersuchungen über das Gehörorgan des Menschen und der Säugetiere* (1845), *Vergleichende Angiologie* (1850), and *Die Blutgefässe der menschlichen Nachgeburt* (1870), he wrote on general anatomy, *Lehrbuch der Anatomie des Menschen* (1846, 20th ed., 1889) and a valuable and original *Handbuch der topographischen Anatomie* (1847, 7th ed., 1882), and on the history of anatomical nomenclature, *Das Arabische und Hebraische in der Anatomie*

(1879), *Onomatologia anatomica* (1880), and *Die alten deutschen Kunstorte der Anatomie* (1884). But his most important work was as a technical anatomist. He had great practical skill, devised special preparations for the dissection of various organs and a microscopical preparation to show the capillary vascular network of the lesser organs, and wrote a *Handbuch der praktischen Zeigheidekunst* (1860).

HYSLOP, his'lop, JAMES (1798-1827). A Scottish poet, born and brought up on a farm in Kirkconnel Parish, Dumfriesshire. He was entirely self-taught, but, while in the employ of a sheep farmer in Muirkirk (1812-16), he became imbued with the Covenant associations of Airdsmoss, which inspired his best poem, 'The Cameronian's Dream' (*Edinburgh Magazine*, 1821). Besides other poems, he published in the same periodical his accounts of a three years' voyage to South America, whither he was taken as tutor on a warship, having had previous experience of teaching in Greenock. After spending three years ashore, in teaching and journalism, Hyslop embarked again as tutor on HMS *Tweed*, but within a month died of fever near the Cape Verde Islands and was buried in the Atlantic. His poems, 82 in all, were published in Glasgow (1887), and two years afterward his masterpiece was set to music by Hamish McCunn (q.v.).

HYS'SOP (AS *ysope*, from Lat. *hyssopus*, *hyssopum*, *hyssopus*, from Gk. ὕσσωπος, *hyssōpos*, ὕσσωπον, *hyssōpon*, hyssop, from Heb. ἔζֶב, sort of aromatic plant), *Hyssopus*.

A genus of one species of the family Labiatae. The common hyssop (*Hyssopus officinalis*), a native of southern Europe and the East and naturalized in the United States, is a half-shrubby evergreen plant, about 1½ feet high, with beautiful blue flowers arranged in one-sided whorled racemes. It has long been cultivated for its aromatic leaves, young shoots, and seeds, which are sometimes used to season salads and soups, but more generally in a dried state as a stomachic and carminative. The virtues of hyssop depend on a volatile oil. A sirup made from the leaves is sometimes used for colds, but the plant is less in favor than formerly. It has been supposed that the hyssop of the Bible is some species of *Phytolacca*, as *Phytolacca acinosa*, a native of Asia and Africa, and the common caper has also been so considered. Hedge hyssop is *Gratiola officinalis*. The giant hyssop is *Agastache nepetoides*. The name "water hyssop" is given the species of *Bacopa*, or *Herpestis*.

HYSTALITE. See **ILMENITE**.

HYSTASPES, his-tās'pēz (Lat., from Gk. Ὑστάσπης). A name found several times in Persian history. 1. It was the name of the father of King Darius I, and according to the Old Persian inscriptions he was Governor of Parthia, and his father's name is given as Arshāma, which agrees also with Herodotus. The name Hystaspes, or Vishtaspa, of the inscriptions is identical in form with (Kavi) Vishtāspa, the

HYSSOP

name of Zoroaster's patron, in the *Alcista*, but there is no historical ground for identifying the two personages, as has been erroneously done by some on the authority of Ammianus Marcellinus. The allusion to Hystaspes in Lactantius in the Church Fathers seems to have reference to Zoroaster's patron. Consult Jackson, *Zoroaster, the Prophet of Ancient Iran* (New York, 1898). 2 HYSTASPES, the son of Darius I and Atossa, was a brother of Xerxes and commanded a force of Bactrians and Sacæ in the latter's army. Consult Justi, *Iranisches Namenbuch* (Marburg, 1895).

HYSTASPES. An ancient Persian author, according to the testimony of several of the Church Fathers. He is supposed to have been a *magus* who wrote a book called *Vaticinia*. Of his life or date we are entirely ignorant. Two passages regarding his writings occur in Justin Martyr—one saying that he foretold the destruction of the world by fire, as the Sibyl did, and the other mentioning the book as an Oriental appendix to the Sibylline works and the prophetic books of the Old Testament. There is in the writing of Clement of Alexandria a reference of doubtful meaning, but usually construed to say that the work was in existence in the second century, and that it referred to the coming of the Messiah and to His kingdom, and another in Lactantius, where Hystaspes, like the Sibyl, is said to predict the destruction of Rome. The name points to Persian origin, but the possibility that it was merely the name of the work, as seems evident from the passage in Clement, when the choice would be due to the fame of the Magians, makes the origin of the work uncertain. Even its existence cannot be considered proved, much less that of an author called Hystaspes. Consult Kuhn, "Eine zoroastrische Prophezeiung in christlichem Gewande," in *Festschrift an Rudolf von Roth* (Stuttgart, 1893), and, for above references to Justin, Clement, and Lactantius, A. C. Cox, *Ante-Nicene Fathers*, vols. 1, 11, vii (Buffalo, 1887).

HYSTERESIS (Neo-Lat., from Gk *ὑστέρησις*, deficiency, from *ὑστερεῖν*, *hysterein*, to be behind, from *ὑστέρος*, *hysteros*, latter, connected with Skt *ud*, AS *ūt*, OHG *uz*, Ger *aus*, Eng *out*). The name given a phenomenon in the magnetization of magnetic substances, which was first observed by Warburg in 1881, and later, in 1885, independently by Ewing, to whom the name is due. It is found that if a rod of iron—or any magnetic substance—is placed in a magnetizing helix, and the electric current through this gradually increased to a certain value and then slowly decreased, the magnetic properties of the rod do not follow the same course when the magnetizing current is decreasing as they did when it was increasing. All the properties due to the magnetization—the induction, the change in length, the change in elasticity, etc.—lag behind the magnetizing force. That is, if these properties have certain values for a given magnetizing force when the current is increasing, they will not return to the same values when, as the current is decreasing, the same magnetizing force is reached, but this force must be still further decreased, or even reversed, before these same values are again obtained. The amount of hysteresis varies greatly with different qualities of iron and steel and with different substances. Its value is most important from a commercial standpoint, because each time the magnetization of a piece

of iron is reversed—as happens at each alternation of an alternating electric current—there is a definite amount of energy lost in heating the iron, and this amount depends on the hysteresis. There is another kind of hysteresis which is quite different. If a given magnetizing current is applied suddenly to a rod of iron, it may not attain its full magnetism instantly, and the fact that time is required to reach this is said to be due to "viscous" hysteresis, or "magnetic lag." For a full discussion of the importance of hysteresis and of the molecular theory, which explains it, consult Ewing, *Magnetic Induction* (London, 1900). See **MAGNETISM**.

HYSTERIA (Lat., from Gk *ὑστέρα*, *hystera*, womb, connected with Lat *uterus*, womb, Skt *udara*, belly). A diseased state of the nervous system, characterized by a great variety of symptoms denoting disordered nervous functions. It was formerly considered to be a disease of the womb, and hence came its name, and it was at one time thought to be trifling and under the control of the will of the patient. Both these ideas are erroneous, for hysteria is frequently found among males and is a disease of very serious nature, involving not only the brain and spinal cord, but also the peripheral nerves and the sympathetic system. The disease is now classed as a psychoneurosis. The psychic element is the more important, although difficult to define, but there are accompanying functional lesions of the sensory and motor nerve tracts. While comparatively rare among Anglo-Saxons, it is said to be widespread among Latin nations and Scandinavians, being especially frequent among the French. Hysteria arises from predisposing causes of an hereditary nature, such as parental alcoholism, epilepsy, insanity, or hysteria, as well as injudicious training or education in youth, with depressing influences, as of surroundings. Exciting causes are overwork, worry, excessive responsibility, sexual excesses, eye strain, profound or prolonged grief, and emotional or other mental shock, and, lastly, severe trauma, such as a railway accident, fall, or blow may produce. Hysteria is found among the working classes as well as among the idle, wealthy, and self-indulgent, who have never learned self-control or practiced self-denial. Two forms of hysteria are described, for reasons of convenience rather than for scientific reasons, as follows: 1 The form of the disease in which the patient is excitable, emotional, and perverse without cause and without intention, and has disturbances of sensation, motion, circulation, secretion, and excretion, usually falling into this condition after strain or stress, a disappointment, or great fatigue. 2 The form of the disease in which the patient has convulsive attacks, known by some as *hysteria major*, in contradistinction to the former variety, which is sometimes called *hysteria minor*. The patient may suddenly sink to the floor, become partly unconscious and rigid, and, either turning pale or remaining rosy, may breathe violently for a few minutes and then recover perfect consciousness. Or the patient may sink to the floor after experiencing a sharp pain or an aura of some sort, uttering a little cry or calling for help, with pale or ashen face and dilated pupils. Convulsions follow rigidity, resembling epileptic convulsions, there may be frothing at the mouth, after a short relaxation, during which the patient gasps, a repetition of the convulsions occurs, with absolute unconsciousness.

Then the patient rolls, tossing the arms and legs about and assuming various rigid positions, occasionally bending the head forward, doubling up the body, clenching the fists, and folding the arms across the chest or the abdomen, or bending the head and feet backward in the pose called *opisthotonos*. After several repetitions of such actions, the patient remaining unconscious, relaxation occurs with a short period of repose, followed at once by attitudes of petition, depression, gayety, etc., the patient being delirious and talking of past events or imaginary encounters, not recognizing, though speaking with, those around her, and controlled by hallucinations of sight and hearing. In a varying time the delirium ceases, and the patient becomes conscious, exhausted, and complaining of tenderness in some part of the body, passes a large quantity of pale, limpid urine, and generally resumes her occupation or goes about her house as if nothing had happened. The whole attack may last from 15 to 50 minutes. If these attacks are frequently repeated, the patient's strength is rapidly undermined, and she may be confined to her bed. The form of hysteria with convulsive seizures is often called *hystero-epilepsy* (qv)—an unfortunate and misleading term, which should not be used. It really means a combination of hysteria and epilepsy in the same person, which is possible but rare.

Hyperalgesia confined to certain spots, circumscribed areas of anæsthesia, or anæsthesia of a half of the body, hysterical deafness, hysterical blindness, twitching of muscles, or contractures of groups of muscles, the *globus hystericus*, or feeling of a lump in the throat, spasmodic closure of the glottis with pseudoasthma, retention of urine, paralysis (either hemiplegia or paraplegia), palpitations of the heart, flushing of face, neck, and scalp, with sweating, coldness of extremities or of the entire body, oedema of the extremities, menstrual irregularities, and vomiting of fluid, are among the symptoms of the disease. Mental changes are certain to occur, amounting only to lack of balance and of will power, or impairment of memory in some, in others also recurring melancholy, rapid emotional play, lack of power of application, impaired judgment, diminished regard for truth, and craving for sympathy. The last two symptoms are the basis for the peculiar actions of "fasting girls", self-mutilating martyrs, alleged sufferers who feign paralysis, pain, tumor, stone in the bladder, etc., and who eagerly submit to surgical operations. The above-mentioned phenomena are sometimes referred to as the stigmata of hysteria.

Hysteria is not dangerous to life. Recovery is rare in prolonged cases, though proper treatment may be followed by cure in cases in which symptoms have reappeared upon provocation many times in the course of a year or two. Harshness used on the erroneous supposition that willfulness or perversity is at the foundation of hysteria always does harm and is unjustifiably brutal. Relief of strain and of worry, change of environment, removal of the patient from home and from accustomed companions in the family, and treatment for indigestion, restoration of function, and nerve building, form the principal features of remedial agencies. Will power must be systematically cultivated, and moral support be given to the patient. Massage, electricity, diet, baths, and sometimes a rest cure, are efficacious.

Psychologically regarded, there are many points of resemblance between hysteria, hypnosis, and dreams, and theories of hysteria tend to correlate the hysterical state either with the hypnotic or with the dream consciousness. An example of the first type is the auto-suggestion theory; hysteria is thought to be a kind of spontaneous hypnosis. We are not told, however, why self-hypnotization should take place, and although many hysterical somnambulisms, anæsthesias, etc., resemble those of hypnosis, the theory is unable to explain the hysterical phenomena which concu with the waking consciousness. Another theory, in some respects similar, is known as the dissociated-idea theory. It is said that in some way, usually as the result of a profound emotional experience, an idea or group of ideas is cut off from the usual train of associations. The field of consciousness is thus restricted, there is a total forgetfulness of other past experiences, and under the dominance of the group the automatisms of hysteria occur. As in the former theory, the state of the hysterical consciousness is regarded as similar to that of the hypnotic consciousness, and the theory is, again, adequate to a large number of phenomena, but the psychology involved in the notion of the dissociated ideas is that of a past generation (see ASSOCIATION OF IDEAS), and the theory fails to explain those hysterias in which consciousness seems to be entirely normal. A third theory finds an intimate relation between hysteria and the dream consciousness, whenever there is an hysterical state, different from the waking consciousness, it is of the same type as the dream. The dream itself is said to be a symbolic presentation which has a remote cause. Briefly, the theory is as follows: at some time previous to the appearance of the hysterical outbreak, usually in childhood, there occurs an experience highly emotional and probably sexual in character, the memory of which is repressed until it plays no part in consciousness. As a result, however, of the conflict between the inhibition and the associative tendency to recurrence, the ideas undergo various transformations until at length they reappear, in dream and hysterical consciousness, in symbolic form, the various symptoms of hysteria are the somatic expressions of the submerged idea. (See DREAMING, FREUD, SIGMUND.) This hypothesis is comparatively recent, and has not yet been brought into relation to current psychological systems, at certain points it needs revision and restatement, but it appears to cover a larger number of facts than any other as yet proposed. (See INSANITY, HYPNOTISM, TEMPERAMENT.) Consult Richer, *Paralysies et contractures hystériques* (Paris, 1892), Janet, *État mental des hystériques les accidents mentaux* (ib, 1894), Fox, *Psychopathology of Hysteria* (Boston, 1913), Freud, *Studien über Hysterie* (2d ed, Vienna, 1909), *Selected Papers on Hysteria and Other Psychoneuroses* (New York, 1912).

HYSTERICS. See HYSTERIA

HYS'TEROEPILEPSY An improper, though frequently employed, term for a variety of hysteria in which convulsive attacks occur, of an epileptoid nature. It is not a form or epilepsy, though not differentiated from that disease till Charcot, of Paris, gave an accurate and intelligent description of hysteria, and often distinguished from it with difficulty. The diagnosis often rests upon the discovery of the stig-

mata of hysteria in the period between the convulsive attacks, as the physician rarely sees the attacks, and the description of the fits by the layman is not reliable Consult Max Nonne, "Ueber Hystero-epilepsie," in *Mittheilungen a d Hamburgurgischen Staatskrankenanstalten*, vol viii (Hamburg, 1910), Margulies, "Zur Frage der Hystero-epilepsie," in *Klinik fur psychische und nervose Krankheiten*, vol. vi (Halle, 1911), Brill, "Hystero-epilepsy (Piblokoto) among the Eskimos," in *Journal of Nervous and Mental Diseases*, vol xl (New York, 1913) See HYSTERIA

HYSTEROTOMY See CÆSAREAN OPERATION.

HYSTRICOMORPHA. See RODENTIA

HYTHE, hîth (AS, haven) A market town and parliamentary borough in Kent, England, 14 miles south of Canterbury With its suburbs it is a favorite seaside summer resort and the seat of the national school of musketry (Map England, H 5) It has an interesting church, under which is an unusual collection of human skulls and bones, reputed to be the remains of Danes slain in a battle fought about

1000 The sea-wall promenade extends 3 miles eastward to Sandgate Hythe owns its water works It is one of the Cinque Ports, but through the silting of its harbor the town proper is now a half mile inland Pop, 1901, 5557, 1911, 6387

HYTHE, THOMAS ALLNUTT BRASSEY, VISCOUNT (1863-) An English publicist, son of the first Earl Brassey (qv) He was educated at Eton and at Balliol College, Oxford, was assistant private secretary to Earl Spencer when he was First Lord of the Admiralty, and assistant secretary to the Royal Commission on Opium in 1894, and became editor of the *Naval Annual* in 1890 In 1892 he contested Epsom Division, Surrey, in 1895 and 1900 Christ Church, and in 1902 Devonport He was the first civil Governor of Pretoria in 1900, initiated the Oxford University Endowment Fund, served as chairman of the Chichester Diocesan Board of Finance, and became lieutenant colonel of the West Kent Yeomen Cavalry He published *The Case for Devolution* (1913) and *Problems of Empire, the Faith of a Federalist* (1904, new ed, with foreword by Earl Grey, 1914).

I

I The ninth letter in the alphabets of western Europe. Its form in the north Semitic and early Greek alphabets, from which it is derived, somewhat resembled a narrow upright Z. (See ALPHABET.)

After various modifications this was straightened into its present shape. The Greek designation, *iota*, of the letter is an adaptation of its Hebrew name *yōd*, 'hand'. Originally the Semitic letter represented the consonantal sound *y*, but later was used also to indicate the vowel *i*. The dot over our small *i* did not come into use until the fourteenth century.

Phonetic Character. The "short *i*" in English is described as a high-front or palatal vowel, made by the blade of the tongue approximating the forward part of the palate or roof of the mouth—the sound heard in *it*. When approximated so far as to make a partial contact or closure, this passes over into a semivocalic or consonantal *y*, as in *you* (*u*), although in English the *y* is often not written, e.g., *myion*, *million*, other variations may be noticed in *charity*, *bird*. The corresponding "long *i*," common in European languages, is found in *machine*, *police*, *prize*. This is sometimes known as the "long *e*" sound in *receive*, *believe*, *seat*. The sound commonly called "long *i*" in English, *wide*, *ice*, and the name of the letter itself (*i* pronounced *eye*), is really a diphthong, like *aisle*, made by premature opening of the lengthened vowel under stress accent. This phonetic change from the older character of the sound was going on during the Middle Period of transition into the Modern English, so that it is now a phonetic rule that Anglo-Saxon or Old English *i* regularly calls for a diphthongal long *i* in Modern English, e.g., OE *wīd*, *mīl* = Mod. Eng. *wide*, *mile*. Historically the linguistic character of *i* is fairly stable, Indo-Germ. **widhewā*, Skt. *vidhāvā*, 'widow,' Lat. *vidua*, OChurch Slav. *vidova*, AS *widewe*, Eng. *widow*, or Gk. *olvos* (for *Foivos*), 'wine,' Lat. *vinum*, AS *wīn*, Eng. *wine*. For the connection of *i* and *y* see J.

As a Symbol. *I* in the Roman notation stands for 1, in chemistry *I* = iodine, in logic *I* is the symbol of the partial affirmative proposition.

I'ABA'DU IN'SULA (Lat., trans. of Gk. *Ἰαβάδιον Νῆσος*, *Iabadiou Nēsos*). According to Ptolemy (vii, 2), a large island in the Indian Ocean, southeast of the Golden Chersonese and southwest of the Isles of Satyrs, said to be very fertile and to contain much gold. The island meant was probably the modern Java, though Humboldt and others think of it rather as

Sumatra. The name, according to Ptolemy, signified Island of Barley. The capital was named Aigyre ('Αργυρή).

IACCHUS, i-āk'kūs (Lat., from Gk. *Ἰακχος*, *Iakchos*). A title used of Bacchus (q.v.) in the Eleusinian Mysteries (q.v.), in which he was regarded as the son or husband of Demeter, or the son of Persephone. He was thus distinguished from Dionysus, the son of Zeus and Semele, but was sometimes called his son and at times identified with him. Consult J. E. Harrison, *Prolegomena to the Study of Greek Religion* (2d ed., Cambridge, 1908).

IAGO, ē-a'gō. A Spanish and Portuguese form of the name James, now occurring only in the combination Santiago (St. James).

IAGO. In Shakespeare's *Othello*, a calculating and malignant character, the ancient of Othello, whom he secretly hates while retaining his confidence. In revenge for imagined wrongs he skillfully concocts evidence which convinces Othello of the unfaithfulness of his wife, Desdemona. Othello in jealousy murders Desdemona and stabs Iago when the plot comes to light.

IALYSUS (Lat., from Gk. *Ἰάλυσος*). An ancient city on the island of Rhodes, on the west coast, near the northern end of the island, possibly a Phœnician settlement, certainly an important place in the Mycænæan period. It was later colonized by Dorians from Argos and joined with Lindus and Camirus the Rhodian Tripolis. Even in the Homeric poems it is famed for its wealth. In 408 B.C. it united with Lindus and Camirus in the foundation of the city of Rhodes (q.v.). Some remains are still traceable near the modern village Ialiso. A necropolis at Ialysus has yielded many Mycænæan vases and other ornaments.

IAM'BI. The name sometimes given by Horace (q.v.) to the poems commonly called epodes. See EPODE.

IAMBIĆ VERSE (Lat. *iambicus*, Gk. *ιαμβικός*, *iambikos*, from *ἱαμβος*, *iambos*, iambus, from *ἵαμειν*, *iapein*, to assail with words). A term applied in classic prosody to verses consisting of the foot or metre called *iambus*, made up of two syllables, of which the first is short and the second long (—). Archilochus (q.v.) is the reputed inventor of iambic verse. The term is also applied by analogy to English verse wherein unstressed and stressed syllables correspond to a short syllable followed by a long syllable in Latin or Greek verse. The English language runs more easily and naturally in this metre than in any other.

IAMBlichus, i-ām'blī-kūs (Lat., from Gk. Ἰάμβλιχος) 1 A Greek writer of the second century A.D., a Syrian by birth, and the author of the earliest Greek romance of which considerable remains have survived. It was entitled *Babyloniaca* and described in 35 books the remarkable adventures of two lovers, Rhodanes and Sinonis. The original romance has perished, but large extracts are preserved by Photius (chap. xciv). Consult Chassang, *Histoire du roman dans l'antiquité* (Paris, 1862), and Rohde, *Der griechische Roman* (1900), and see **PHOTIUS**

2. A Neoplatonic philosopher, born at Chalcis in Coele-Syria about 283 A.D. He lived mostly at Alexandria. He studied under the Neoplatonists Anatolius and Porphyrius and became deeply imbued with the teachings of Plotinus, which he expounded for many years to a large circle of hearers at Alexandria, but with a considerable admixture of his own peculiar views. He died at Alexandria about 330 A.D. His doctrines were a mixture of Pythagorean and Platonic ideas, with much superstition and magic, and the supposed manifestation of God by ecstasies, and a communication with the spiritual world by means of ceremonies. He was a voluminous writer, but most of his writings are lost. Perhaps they were destroyed by the Emperor Constantine, who ordered the burning of the works of Porphyrius. Of his work, *Περὶ Πυθαγόρου Αἰδέσεως*, in 10 books, we possess four complete sections, viz. *On the Life of Pythagoras* (*Περὶ τοῦ Πυθαγορικοῦ Βίου*), edited by Nauck (St Petersburg, 1884), *Exhortation to Philosophy* (*Προπαιδευτικὸν Δόγμα εἰς Φιλοσοφίαν*), edited by Pistelli (Leipzig, 1888), *On Mathematics* (*Περὶ τῆς Κοινῆς Μαθηματικῆς Ἐπιστήμης*), edited by Festa (ib., 1891), and an introduction to the *Arithmetic* of Nicomachus, edited by Pistelli (ib., 1894). There is also in existence a work on *Mysteries* (*Περὶ Μυστηρίων Λόγος*), which is attributed to Iamblichus, but the attribution has been questioned, perhaps without reason. On Iamblichus and his philosophy, consult A. E. Chaignet, *Histoire de la psychologie des Grecs*, vol. v (Paris, 1893), Eduard Zeller, *History of Greek Philosophy* (New York, 1889); T. Whittaker, *The Neo-Platonists* (Cambridge, 1901). See **NEOPLATONISM**

IANTHE, i-ān'thē. 1 In Roman mythology, a girl to whom Iphig was betrothed (Ovid, *Met.*, ix, 12). 2 A character in Sir William Davenant's *The Siege of Rhodes*. 3 Lady Charlotte Harley, to whom, under the name of Ianthé, Byron dedicated his *Child of Harold*. 4 A character in Shelley's *Queen Mab*.

IAPETUS (Lat., from Gk. Ἰαπετός). One of the Titans (qv), son of Uranus and Gæa, father, according to Hesiod, of Atlas, Menæceus, Prometheus, and Epimetheus. Through Prometheus he is ancestor of Deucalion (qv) and so of the human race. He rebelled against Jupiter and so was confined in Tartarus, or under the island Inaime, off the coast of Campania. Many scholars suppose his name to be identical with that of the biblical Japhet; others, like Maximilian Meyer, *Giganten und Titanen* (Berlin, 1887), deny any such connection.

IAPYGLIA, i-a-pij'i-a (Lat., from Gk. Ἰαπυγία). A name given to the southeastern district of Italy, forming the heel of the peninsula, also called Messapia. The name Iapygia was familiar to the Greeks, but was not known to the Romans.

IASI. See **JASSY**

IBA, ē'ba. The capital of the Province of Zambales, Luzon, Philippines (Map Philippine Islands, B 3). It is situated on the Iba River, 85 miles northwest of Manila, and has a post office and telegraph station, fine public buildings, and a town hall. Pop., 1903, 4482.

IBADAN, ē-ba'dan. The chief commercial city of the Yoruba, in the interior of the English colony of Lagos in Nigeria, Africa, 123 miles northeast of Lagos (Map Africa, E 4). It is a walled town, mainly of mud huts, situated on a small river, the Ona. There are many mosques and idol houses. The chief industry is agriculture. Its population is estimated at 150,000, including the people outside the walls.

IBAGUÉ, ē'ba-gá'. Capital of the Department of Tolima, Colombia, situated 60 miles west of Bogotá, on a fertile plain, at an altitude of over 4000 feet (Map Colombia, B 3). It has a temperate and healthful climate and is a prosperous town of considerable commercial importance. There are a number of sulphur and silver mines in its vicinity. Pop., 1912, 23,607. Ibagué was founded in 1550 and was in 1854 the temporary capital of the Republic.

IBAJAY, ē'ba-hí'. A town of Panay, in the Province of Capiz, Philippines, situated at the mouth of the Ibañay River, 43 miles northwest of Capiz. The town formerly stood at the Point of Potoi (Map Philippine Islands, D 5). Pop., 1903, 14,774.

IBANAG, ē'ba-nag'. The speech of the Cagayan people in Luzon. See **PHILIPPINE ISLANDS**

IBÁÑEZ DE IBÁÑEZ DE IBERO, ē-ba/-nyāth dā ē-ba'-nyāth dā ē-bā'rū, CARLOS, MARQUIS OF MULHACEN (1825-91). A Spanish military engineer and geodetist, born in Barcelona. As a result of his work in geodesy and geography, both in Spain and in other countries, he was given the title of Marquis of Mulhacén and was elected to many scientific societies. His publications include *Base central de la triangulación geodésica de España* (1865), *Descripción geodésica de las islas Baleares* (3 vols., 1871), *Tableau géographique et statistique de l'Espagne* (1888).

IBARRA, ē-bar'ra. The capital of the Department of Imbabura, Ecuador, situated at an altitude of over 7000 feet, 60 miles northeast of Quito (Map Ecuador, B 3). It has some cotton and woolen mills and a population of about 10,000. Once a considerable town with a population of about 16,000, Ibarra was almost wholly destroyed by the earthquake of 1868.

IBARRA, JOAQUÍN (1725-85). A Spanish printer, born at Saragossa. He was appointed court printer at Madrid. The following works from his press are among the masterpieces of the art of printing: a translation of Sallust by the Infante Don Gabriel (1772), an edition of Cervantes' *Don Quixote* (4 vols. quarto, 1780, 4 vols. octavo, 1782), the *Historia de España* of Mariana (2 vols., 1780), and several fine editions of the Bible.

I BEAM. See **STEEL SHAPES**.

IBERCOURT, ē'bār'kōōr', HENRY LOUIS D' (1771-1818). A Flemish traveler, born in Mons. His journeyings began in the West India Islands and extended over a great part of South America. His narrations include *L'Amérique dévoilée* (1811), *Voyage en Chili* (1812), *Nouveau traité*

sur les légumineuses de l'Amérique du Sud (1815). He also wrote a romance, *Un voyageur captif en Patagonie* (1814), and a pamphlet, *La constitution des Etats-Unis, est-elle applicable à l'Europe?* (1818), which so deeply offended the Dutch government that the author suffered a short term of imprisonment.

IBERES, i-bé-réz. See **IBERIAN**, **HISPANIA**.

IBERIA. See **HISPANIA**.

IBERIAN LANGUAGE. See **GEORGIAN LANGUAGE**.

IBERIAN MADONNA. A wonder-working picture in the Kremlin, Moscow.

IBERIAN (Lat. *Iberes*, Gk. Ἰβηρες). A people anciently living at the mouth of the Iberus (Ebro) River in eastern Spain. Later the inhabitants of the entire peninsula were so called. The term is now applied to the primitive Neolithic and Bronze-age men whose remains and relics are found in ancient graves, grottoes, and refuse heaps throughout western Europe. Their ovoid and ellipsoid crania, called Pelasgic type by Sergi, resemble those of ancient Italy, Greece, Asia Minor, Egypt, Ethiopia, and north Africa, belonging to what he denominates the Mediterranean race. Keane also quotes Von der Gabelentz in the proof of identity between the Basque (Iberian) and the Berber speech. This long-headed man, of low stature, has been traced as far as the British Isles and is identified with the Picts and other groups. The term Iberian is used by English ethnologists for the Mediterranean race, and Deniker's title for the same group is Ibero-Insular. Keane subdivides the historical Iberian (Basque) as follows. The descendants from old extinct Iberian are

Euscara (Spanish Basque)	{ Gupuzcoan Biscayan, or Upper Navarrese North Upper Navarrese South
Basconse (French Basque)	{ Labordin Souletin, or Lower Navarrese East Lower Navarrese West

Consult Keane, *Man Past and Present* (Cambridge, 1899), and Sergi, *Mediterranean Race* (London, 1901). See **MEDITERRANEAN RACE**.

IBERIS. See **CANDYTUFT**.

IBERUS. The ancient name of the river Ebro (qv).

IBERVILLE, é-bâr-vél'. A town and the county seat of Ibergville Co., Quebec, Canada, on the Richelieu River, and on the Canadian Pacific, the Quebec, Montreal, and Southern, the Central Vermont, and the Rutland railways (Map Quebec, E 5), opposite the town of St John's, and about 40 miles southeast of Montreal. Its manufacturing establishments include two iron factories, three potteries, two agricultural-implement factories, monument works, and a carriage factory. Pop., 1901, 1512, 1911, 1905.

IBERVILLE, PIERRE LE MOYNE, SIEUR D' (1661-1706). A French-Canadian soldier, naval commander, and explorer, founder of Louisiana. He was one of the 10 famous sons of Charles le Moyne of Montreal. He studied seamanship in the French navy, but his first exploits were inland—from the Ottawa north to James's Bay, with an expedition destined to gain possession of the English forts there (1686). He took part in the expedition for the destruction of Schenectady (1690). After capturing (1696) and demolishing the stone fort at Pemaquid, built to protect New England, Ibergville thought of taking Boston, but sailed instead to Newfoundland,

where he burned the village of St John's, laying waste all the British settlements on the island. Thence he steered for Hudson Bay, where he had a gallant victory over three English ships against his one and destroyed the last remaining post of the Hudson's Bay Company. From the Far North he went to the Far South, sailing from France (1699) to the Gulf of Mexico in search of the mouth of the Mississippi, found it, and built a fort at Biloxi (qv), changing afterward to Mobile, thus fulfilling La Salle's dream of planting a French colony on the Gulf. He left Canada in 1702 and was made a captain in the French navy. In 1706 he was placed in command of a small fleet and went on a cruising expedition. When in the West Indies, he was taken ill and went to Havana, where he died.

IBEX (Lat. *chamois*). The ancient name of the steinbock of the Alps, and now designating a section or subgenus of goats having the horns flat and marked with prominent transverse knots in front, whereas those of the typical goats are compressed and keeled in front and rounded behind. The group contains four species, all inhabitants of high mountainous regions, as described below. All are characterized by a nearly uniform coloration, but the hue varies with age and season, from gray, yellowish, or grizzled, to various degrees of brown, usually lighter on the throat, belly, and inside of the legs than elsewhere. The short summer coat is exchanged in winter for a longer, warmer one, mixed with an under wool. The pairing season of all is in mid-winter, and the kids, usually two, are born in early summer. Cf. **GOAT**, and see **PLATE OF WILD GOATS**.

The typical ibex (*Capra ibex*), called bouquetin by the French, and steinbock by the Germans, has long been exterminated as a wild animal, but is preserved by the Italian government in a few valleys of the Piedmontese region. Formerly it seems to have roamed all over the Alps of Switzerland, Savoy, and the Tirol, but always kept as high as possible, seeking its food, mainly by browsing bushes, at the edge of the snow, and not descending the valleys as does the chamois. Though larger and more powerful than the common goat, it is smaller than the other ibexes. The horns rarely exceed 30 inches in length and have the knobs not prominent, while the beard of the males is so small as to be hardly visible in the summer coat. This ibex is easily tamed when taken young and interbreeds readily with domestic goats.

The Himalayan ibex (*Capra sibirica*) is still numerous and well known to sportsmen. A ram stands 40 inches high at the withers, has a heavy beard, and the roughly knobbed horns often measure more than 50 inches along the outside curve and 11 to 12 inches in greatest girth. It inhabits all the mountain ranges of Central Asia from the borders of Persia eastward to the frontier of Tibet and northward into Siberia, and is found not only on the summits, but on the open plateaus of the Pamir. Ordinarily, however, ibexes remain upon the crags as near as possible to the snow line. They descend in winter only so far as is necessary to find uncovered pasturage and often linger at that season at great altitudes, where the wind sweeps steep slopes and allows them to nibble a scanty subsistence from the withered herbage. The resistance to cold and hardness of constitution generally which this implies are characteristic of the race. They usually go about in small bands, led by old rams,

but sometimes gather into herds of 100 or more. In the spring the males separate from the band and betake themselves to the highest crags, while the females seek retired places in which to bring forth their young. In spite of constant pursuit by hunters, the ravages of wild dogs, and destruction by avalanches, these animals seem to maintain their numbers (except near Kashmir), as they are prolific and accustomed to wandering widely. Ibex shooting is one of the most exciting and difficult feats offered to the sportsman, because of the nature of the country in which the animals live and their extreme wainness and ability to escape down precipices and over crags which baffle their pursuers. The books of men like MacIntyre, Kinloch, Markham, Pollok, and other Anglo-Indian sportsmen are full of entertaining accounts of this adventurous hunting, and to these observers we owe most of our knowledge of the haunts and habits of these animals.

The Arabian ibex (*Capra sinaitica*), or bedouin, occupies the rough heights of the Sinaitic Peninsula, Arabia Petraea, Palestine as far as Lebanon, and Upper Egypt. It is rather smaller than the Himalayan, and the knobs on the front of the horns are less prominent and regular. An Abyssinian species, the walia (*Capra walia*), also exists, and differs from the others in the curvature of its horns and a protuberance in the centre of the forehead.

IBILAO, ʔʔʔʔʔʔ See ILONGOT

IBIS (Lat. *ibis*, Gk. *ibis*, of Egyptian origin).

A storklike bird of the family Iridæ. The bill is long, slender, curved, thick at the base, the point rather obtuse, the upper mandible deeply grooved throughout its length. The face, and generally the greater part of the head, and sometimes even the neck, are destitute of feathers, at least in adult birds. The neck is long. The legs are rather long, naked above the tarsal joint, with three partially united toes in front and one behind, the wings are moderately long, the tail is very short. The family is usually ranked with the storks in the same order as the herons, but there are important points in which the ibises approach the curlews. The sacred ibis, or Egyptian ibis (*Ibis æthiopica*), is an African bird, 2½ feet in length, although the body is little larger than that of a common fowl. The glossy ibis (*Plegadis*, or *Egathens, falcinellus*) is a smaller species, also African, but migrating northward into continental Europe and occasionally seen in Great Britain. It occurs in the tropical and subtropical parts of all the world, but is quite uncommon in North America, where ornithologists call it *Plegadis autumnalis*. In the southwestern United States it is replaced by the white-faced glossy ibis (*Plegadis guarauna*), a species in which the adults have the region about the base of the bill white. The habits of both species resemble those of the sacred ibis. The color is black, varied with reddish brown and exhibiting fine purple and green reflections. There are no loose pendent feathers. The white ibis (*Guara alba*), a species with pure white plumage, abounds on the coasts of Florida and is locally abundant as far north as South Carolina and southern Illinois. Audubon saw multitudes on a low islet and counted 47 nests on a single tree (For its egg, see Colored Plate under Egg). The scarlet ibis (*Guara rubra*) is a tropical American species, remarkable for its brilliant plumage, which is scarlet, with the tips of a few outer primaries glossy black. The straw-necked ibis (*Orphibis spinicollis*) is a large

Australian bird of fine plumage, remarkable for stiff, naked, yellow feather shafts on the neck and throat, which look extraordinarily like bits of straw. The bird known in the southern United States as wood ibis is not an ibis at all, but a stork (q.v.).

The sacred ibis, one of the birds worshiped by the ancient Egyptians and called by them *hab* (or *hib*) and by the modern Egyptians *abu-Hannes* (i.e., Father John), is a bird with long beak and legs and is covered with black and white plumage. It was supposed, from the color of its feathers, to symbolize the light and shade of the moon, its body to represent the heart, its legs described a triangle, and with its beak it performed a medical operation, from all which esoteric ideas it was the avatar of the god Thoth, or Hermes (see MERCURY), who escaped in that shape the pursuit of Typhon, as the hawk was that of Ra, or Horus, the sun. Its feathers were supposed to scare, and even kill, the crocodile. It appeared in Egypt at the rise, and disappeared at the inundation, of the Nile, and was thought at that time to deliver Egypt from the winged and other serpents which came from Arabia in certain narrow passes. As it did not make its nest in Egypt, it was thought to be self-engendering, and to lay eggs for a lunar month. According to some, the basilisk was engendered by it. It was celebrated for its purity and drank only from the purest water, and the most strict of the priesthood drank only of the pools where it had been seen, besides which it was fabled to entertain the most invincible love of Egypt and to die of self-starvation if transported elsewhere. Its flesh was thought to be incorruptible after death, and to kill it was punishable with death. Ibises were kept in the temples and unmolested in the neighborhood of cities. After death they were mummied, and there is no animal of which so many remains have been found at Thebes, Memphis, Hermopolis Magna, or Eshmun, and at Ibru, or Ibeum, 14 miles north of the latter place. They are made up into a conical shape, the wings flat, the legs bent back to the breast, the head placed on the left side, and the beak under the tail. They were prepared as other mummies and wrapped up in linen bandages, which are sometimes plaited in patterns externally. At Thebes they are found in linen bandages only, at Hermopolis, well preserved in wooden or stone boxes of oblong form, sometimes in form of the bird itself or the god Thoth, at Memphis, in conical sugar-loaf-shaped red earthenware jars, the tail downward, the cover of convex form, cemented by lime. There appear to be two sorts of embalmed "ibises"—a smaller one of the size of a rail, very black, and the other black and white. The former is not an ibis at all, but some smaller wading bird. The last is usually found with its eggs, and with its food in its stomach. By the Jews it was held to be an unclean bird. Consult Pettigrew, *History of Egyptian Mummies* (London, 1840), Wilkinson, *Manners and Customs of the Ancient Egyptians* (New York, 1879); Whymper, *Egyptian Birds* (London, 1909). See Colored Plate of Eggs.

IBIZA See IVIZA.

IBLIS One of the names of the Devil, in the Koran, who, however, is more often called *Shaitān* (Satan). Iblis is the chief of the fallen angels, who was once a good angel named Azazel, but, having refused at God's command to render homage to Adam, was first condemned to death,

but subsequently respite till the judgment day (Koran, vii, 13). The legend is borrowed from Jewish sources and is embodied in the Midrashic exposition of Genesis, iii (consult Wunsche, *Midrash Bereshit Rabba*, pp 32 et seq., Leipzig, 1881). Both words for devil used by Mohammed appear to be of foreign origin, the form *Shaitān* coming close to the designation of Satan in Ethiopic, while *Iblis* may be a distortion of *diabolus*, modified in order to adapt it to a derivation from an Arabic stem *balasa*, 'to confuse,' with which, however, it has really nothing to do. Of the two terms, the former is found in the Koran 87 times, the latter only 11 times. Moreover, the plural of the former is used, whereas the latter occurs only in the singular, and was regarded by Mohammed as a name for a specific devil, the arch devil spirit, *Shaitān*, both in the Koran and the later literature, is used as a general designation for devils or evilly disposed demons. On the basis of the utterances in the Koran, the doctrine of the Devil is further developed in Mohammedan theology, influenced by the specifically Christian and Jewish conceptions current in the Orient whereby the Devil, as a single personage, usurps the powers and attributes of the numerous body of jinn (qv) of popular belief. The latter, however, as a survival of primitive religion, continue to hold sway among the people in general, so that in the folklore of the Arabs it is the jinn who are constantly introduced, both for good and evil purposes, whereas the mention of Iblis and of the Satans is largely confined to the body of theological writings. In the latter the contrast between the Devil and the angels is prominently put forward, and the view is expressed that each individual has a devil and an angel appointed as his companions—the former tempting him to evil deeds, the latter prompting him to good. The life of man passes in a constant struggle to be rid of the former and to keep close to the latter. Consult Weil, *Biblische Legenden der Muselmanner* (Frankfurt, 1845).

IBN ABI USEIBIA, ib'n a'bē ō-sā'bē-a, MUWAFFAK AD-DIN (1203-70). An Arabic physician and author. He was born in Damascus, of a family of physicians, lived in Egypt and Syria, and was educated at Damascus and Cairo (1227-33). For two years he was head of a hospital at Cairo, then he became court doctor to a Syrian emir near his home city. He is best known for his biographical lexicon of Mohammedan physicians (1245-46), which has been edited by August Muller (Königsberg, 1884) and commented on by the same in *Ueber Ibn Abi und seine Geschichte der Aerzte* (Leyden, 1885). Consult Wüstenfeld, *Geschichte der arabischen Aerzte und Naturforscher* (Göttingen, 1840), Leclerc, *Histoire de la médecine arabe* (Paris, 1876), *Travaux de la VIème session du Congrès international des Orientalistes à Leide*, vol II (Leyden, 1884).

IBN AL-ATHIR, ib'n al-a-tēr', IZZ-AD-DIN AL-JAZARI (1160-1234). An Arabic historian, who was born of good family in Mesopotamia and lived in Mosul. He wrote *Kamil*, a history of the world to the year 1231, edited by Toinberg under the title *Ibn-el-Athir Chirmonon quod Perfectissimum Inscriptur* (1851-76), *Usd al-ghāba*, on the successors of Mohammed (1864), and a lexicon, edited by Seybold (Weimar, 1896). Excerpts from his other works may be found in Reinaud, *Historiens des croisades* (Paris, 1829).

IBN AL KHATIN. See FAKHR-AD-DIN

IBN AL KIFTI. See KIFTI

IBN ARABSHAH, ib'n a'rab-sha', AHMED (1392-1450). An Arabic author, born at Damascus. He was carried captive with his family (1400) to Samarkand, after the invasion of Syria by Timur, took advantage of this opportunity to study Turkish and Persian, traveled through Mongolia and Astrakhan, and at Adrianople was employed by the Sultan to translate Arabian writings into Turkish and Persian. The most important of his works is the history of Timur or Tamerlane and his period (last ed, Calcutta, 1818). The book of anecdotes written by him has been published by Freytag, with a Latin translation, under the title *Fructus Imperatorum et Jociatio Ingeniosorum* (2 vols, Bonn, 1832-52).

IBN BAJJA, ib'n ba'ja. See AVEMPACE

IBN BATŪTA, ib'n ba-tū'ta, ABU ABDALLAH MOHAMMED (1304-77). The greatest Mohammedan traveler of all time. He was born at Tangier, Morocco, and spent 25 years (1325-50) in traversing western and Central Asia, large portions of Africa, Russia, India, China, and Spain. For three and one-half years he acted as cadī at Delhi and in the Maldives Islands. After his travels he settled in Morocco. His narrative of his journeys, replete with graphic and picturesque description, has been published in the French translation by Defrémery and Sanguinetti (Paris, 2d ed, 1874-77). There is an English translation from an epitomized version by S Lee (1829).

IBN DORĀID, ib'n dō-rā'ed, MOHAMMED (837-934). An Arabic poet and scholar, born at Basra, and later resident in Oman, Persia, and Bagdad. His most famous poem is the elegy entitled *Alkasida-al-Maksura*, dealing with the question of good luck and bad. Among his philological works may be mentioned an etymological and genealogical dictionary of Arabic proper names, edited by Wüstenfeld (1853-54), and two briefer studies in lexicography, edited by Thorbecke (1882).

IBN EZRA, ib'n-ēz'ra. See ABEN-ESRA

IBN FARĪD, ib'n fa-rā'id', ABU' KASIM UMAIY (1181-1235). An Arabian poet. He was born in Cairo, lived for some time in Mecca, but died in his native city. While his poetry has been admired for its subtlety and beauty, it is especially as a mystic, a representative of Sufism, that he has exercised a considerable influence. His *divan* (qv) was published at Benut in 1887, it has also been published with the commentaries of Burini, in 1615, Abdu'l Ghani, in 1853, and Rushayyad Ghitab in 1893. One poem was edited by Hammer-Purgstall under the title *Das arabische Lied der Liebe* (Vienna, 1854). Consult Nicholson, *A Literary History of the Arabs* (London, 1907).

IBN HANBAL, ib'n han'bāl, ABU ABDALLAH AHMED (780-855 A.D.). The founder of the fourth orthodox sect of the Sunnites. He was born at Bagdad, but his parents came from Merv. He was instructed there by Al Shafi'i. In the dispute as to whether the Koran was eternal or had been created Ibn Hanbal maintained the former opinion, which incensed against him the Caliph al Mutasim. He was imprisoned in 842 and, it is said, scourged. Al Mutawakkil, however, issued an edict of toleration in 846, and Ibn Hanbal was set free and offered a compensation for his sufferings. Thousands listened to his lectures, and his great work,

the Musnad, containing some 30,000 traditions selected from a much larger number, has had a great influence. He emphasized strongly tradition and rejected absolutely subjective decisions. Ibn Hanbal himself is probably not to be held responsible for the doctrine that Allah had set Mohammed on his throne, which has been widely spread among the Hanbalites. The influence of his school is very slight at the present time. Consult Brockelmann, *Geschichte der arabischen Literatur*, 1, 181 (Weimar, 1898). See MOHAMMEDAN SECTS.

IBN HISHAM, ib'n hê-sham', ABU MOHAMMED ABD AL-MALIK (c760-834). An Arabic scholar of Fostat. He is famed for his genealogical writings and his revision of the life of the Prophet Mohammed, written by Ibn Ishak (c700-768). The biography was edited by Wustenfeld (Göttingen, 1858-60), and translated into German by Weil as *Das Leben Mohammeds* (1864).

IBN JANACH, Eb'n ha-nach', ABULWALID MERWAN, or JONAH MABINUS. A Jewish grammarian of Spain. He was born near the end of the tenth century and died about the middle of the eleventh century, but the exact dates are unknown. He studied Hebrew at his birthplace, Cordova, and in Lucena, under Jewish teachers, and also took up the study of medicine. In 1012, in consequence of political disturbances, he was obliged, with many other Jews, to leave Cordova and settled in Saragossa, where he appears to have spent the rest of his days, and where, while continuing his practice of medicine, he devoted himself also to the investigation of Hebrew grammar, guided largely by the researches of his predecessor, Hayyug (qv). Ibn Janach was enabled to advance the knowledge of Hebrew morphology far beyond the point that Hayyug had reached. He did not hesitate to make slight changes in the biblical text where it seemed to be meaningless as it stood. His main work consists of two parts—the first dealing with grammar, *Kitâb-al-Luma*, published by J. Derenbourg (Paris, 1886); the second a lexicon, *Kitâb-al-'Usûl*, published by Neubauer (Oxford, 1873-75). The grammar, based on Arabic models, is the first systematic attempt to cover the entire field of Hebrew grammar. The dictionary is characterized by the same comprehensive knowledge and clear perception as the grammar and, incidental to the explanation of words, furnishes valuable and elaborate discussion of grammatical points. Both the grammar and the dictionary were translated by Judah ben Saul Ibn Tibbon (c1120-90)—the former having been published by B. Goldberg (Frankfort, 1856), the latter by W. Bacher (Leipzig, 1889). He also wrote several minor grammatical treatises (published by J. and H. Derenbourg, Paris, 1880), in which he defended his views and those of Hayyug against attacks and also amplified the grammatical treatises of the latter. Ibn Janach was also interested in philosophical questions and strenuously opposed the speculations of Ibn Gabirol and other men of the day on the relation of God to the world, on the ground that they led to unbelief. Consult Bacher, *Leben und Werke des Abulwalid Merwan ibn Ganach* (Leipzig, 1885).

IBN KHALDUN, ib'n kal-dûn', ABD AL RAHMAN (1332-1406). The greatest of Arabic historians and one of the profoundest students of the philosophy of history in all ages. He

was born at Tunis, of a family that had long lived at Seville, but originally came from Hadramaut. Among his ancestors were many eminent men, soldiers, administrators, philosophers, and writers. He early entered the public service, first in Tunis, then at Fez and Tlemcen. In 1362, under the Sultan of Granada, he carried on negotiations for peace with Pedro of Castile, in 1374 he was imprisoned for political reasons in a castle in northern Africa, where he spent his time in historical research, but was permitted to return to Tunis in 1378. Here he finished his famous introduction and wrote the history of the Berbers. In 1382 he set out for Mecca, but remained three years in Egypt, where he gained great favor with the Mameluke rulers and was appointed as cadî at Cairo. After his pilgrimage he returned to Egypt and frequently held judicial positions, though his opposition to the bribery, violence, and wrongdoing of powerful officials often deprived him of his place. In 1400 he was sent as an envoy to Timur, then besieging Damascus. Timur was deeply impressed with the knowledge and wisdom of the great historian. The last years of his life he spent in Egypt, and he held the position of cadî when he died. He was the first among the Arabs to leave the annalistic method, and the first historian to examine carefully the influence of the physical environment, the occupations it indicated for men, the food supply, the manner of life, the religious ideas, on the development of states and empires. He called attention to the differences between nomadic, agricultural, and city life, and pointed out the strength and weakness of each. The enthusiasm created by a universal religion appeared to him to be the sole force that could neutralize the tribal instincts and lead to empire building. Surveying the history of the Moslem world for more than seven centuries, observing the growth and decay of caliphates and sultanates, searching for the deeper-lying causes of progress and arrest, considering the religious ideas, sentiments, and institutions as factors in the building up of social and political organisms—he learned a new method of approach to all historical phenomena and realized himself that he had discovered a new science. His greatest contribution is the *Introduction to History*, edited by Quatremère (Paris, 1858) and translated into French by De Slane (Paris, 1862-68). In this voluminous work he lays down his fundamental conceptions of what the historian's task involves. Centuries passed before the Western world, ignorant of its existence, produced a work in this field worthy of a place beside it. A part of his *History of the Eastern Caliphate* was edited with a Latin translation by Tornberg under the title *Ibn Khaldun Narratio de Expeditionibus Francorum* (1840), and the *History of the Berbers* was edited and translated into French by De Slane (Paris, 1862), the publication of a new French translation, with introduction, was begun in 1914. Ibn Khaldun's style is often prolix and obscure, it is by the weight of his ideas, his critical insight, his questioning of the sources, and his breadth of view, rather than by literary power and elegance, that he evinced his mastery and holds the attention. Consult Alfred von Kremer, *Ibn Khaldun und seine Kulturgeschichte der islamischer Völker* (Vienna, 1879), A. Muller, *Islam im Morgen und Abendland*, vol. II (Leipzig, 1886), Carl Brockelmann, *Geschichte der*

arabischen Literatur, vol II (ib, 1893), R A Nicholson, *A History of Arabic Literature* (Cambridge, 1907), C I Huart, *Histoire des arabes* (Paris, 1912)

IBN KHALLIKAN, ib'n ka'lê-kan', SHAMS AL-DIN AHMED (1211-82). An Arabic historian and biographer, born at Arbela, of the family of the Barmecides. He held important offices, both civil and educational, in Cairo and in Damascus, where he died. His most important work is a biographical dictionary, a very important source of knowledge of Arabian literature and its history from the eighth century to his own time. It is edited by Wustenfeld (Göttingen, 1840-65) and translated into English by MacGuckin de Slane (4 vols, London, 1842-71).

IBN KUTAIBA, ib'n kû-ta'ê-ba, ABDALLAH (828-c 889). An Arabic philologist and historian. He was born probably at Bagdad or Kufa and for some time held high judicial offices at Dinawâr. Later he was a teacher in Bagdad and died there. Of his works, the most important are *Adab al-Kâtib*, mainly philological and of great value on literary style and on antiquities, of which Sproull published a part as *An Extract from Ibn Koteiba's Adab al-Kâtib* (1877) and which was edited by Grunert (1900), a collection of biographies of the Arabian poets, published by De Goeje (Leyden, 1904), *Kâtib al-ma-Arif*, an outline of history for practical use, edited by Wustenfeld (1850), and *Uyun al akhbâr*, a treatise upon government, war, nobility, character, science, friendship, food, women, and other topics, edited by Brockelmann (Weimar, 1898).

IBN ROSHD, ib'n rôsh't. See AVERROES.

IBN SAYIGG, ib'n si-eg'. See AYEMPAACE.

IBN SINA, ib'n sê'na. See AVICENNA.

IBN TOPHAIL, ib'n tô'fa-el. See ABU-BEKR MOHAMMED IBN TOPHAIL.

IBN TUMART, ib'n tô'ma'it, MOHAMMED (?-1128 A D). The founder of the sect of the Almohades (qv). He was born in the Deren Mountain in the Province of Sus in southwest Morocco, probably in the last third of the eleventh century. In 1107 he went to Cordova, then to Mecca for the pilgrimage, and to Bagdad, where he studied theology from the standpoint of the Asharite school. It is not probable that he came into personal contact with Ghazali (qv), but he was obviously influenced by him. After his return to Africa he preached at Tripolis and Bougie his doctrine of unity. He opposed both the anthropomorphic views of Allah held by many orthodox Moslems and the allegorical exegesis by which the references to Allah's mouth, face, hands, and feet were explained by the Mutazilites as denoting abstract qualities, emphasized the unity of the divine being, denounced as idolaters those Moslems who held the current opinions, and made the Almoravides responsible. His criticism of the government led to his expulsion from Bougie in 1118, and in 1121 he openly declared himself to be the Mahdi, as Ubaidallah, the founder of the Fatimid sect, had done before him. Essentially he remained a Sunnite, but of the Shiite doctrines he accepted that of the infallibility of the Imam. As Mahdi, he felt himself to be called by Allah to check unrighteousness and destroy error and therefore to wage war against the government that supported what he regarded as idolatry. After his first successes he made Tin Mallal his capital, the ruins of this city

were discovered in 1901 by Edmond Doutte. He died probably, as Ibn Khaldun states, in 1128. Ibn Tumart seems to have maintained to the end consistently the ascetic mode of life that won for him so many adherents among the Berber tribes, his was evidently an intense religious nature, his works show an eager study of the Koran and the traditions, and also much sound practical wisdom. His destruction of wine jars and musical instruments may have been due to conviction. Nevertheless his sincerity has been seriously questioned, particularly on the ground that he is said to have claimed miraculous power (though this is not certain), that he declared himself a descendant of Ali, and that he used his theological definitions as a means of justifying a war upon fellow Moslems and as a cloak for his personal ambition. He has been compared with Abd al Wahhab, but whether the charges brought against his character can be fully sustained or not, he does not seem to have possessed the moral integrity and genuine prophetic fervor of the founder of the Wahabite sect. Consult A. Muller, *Der Islam*, II, 640 ff. (Berlin, 1887), Goldziher, *Mohammed ibn Tountart et la theologie de l'Islam dans le Nord de l'Afrique au XIe siècle*, which appeared as an Introduction to Luciani, *Le livre d'Ibn Tountart* (Algiers, 1903), A. Bel, *Les Benou Ghanya* (Paris, 1903), id., article "Almohaden," in *Enzyklopädie des Islam* (Leyden, 1910).

IBN ZOAR, ib'n zôr, or IBN ZUHR. See AVENZOAR.

IBOS, ê'bôz. Dominant negro people of the Niger Delta. Their number is estimated at about 3,000,000. Slaves from this region formerly were called Ibo. Their language is akin to the Ewe and the Tshi. Consult N. W. Thomas, *Anthropological Report on the Ibo-Speaking Peoples of Nigeria* (3 vols, London, 1913).

IBRAHIM, ê'bra-hêm' (1615-48). An Ottoman Sultan, third son of Ahmed I. On the death (1640) of his brother, Amurath IV, whose cruelty he had escaped by feigning madness, he came to the throne. In 1645 he attacked the island of Crete, which was then under the control of Venice, but did not live to finish this war, which was the result of an intrigue in his harem. His government was so cruel and the taxes so oppressive that in 1648 the Janizaries rebelled and strangled him.

IBRAHIM OU L'ILLUSTRE BASSA, ê'bra'hêm', ôô lê'lus'tr' ba'sa'. A romance by Mademoiselle de Scudéry, originally published under the name of her brother (1641).

IBRAHIM PASHA, ê'bra-hêm' pa-sha' (1789-1848). An Egyptian general. He was the adopted son of Mehmet Ali (qv), Governor and subsequently Viceroy of Egypt, and was born at Kavala in the Province of Saloniki in European Turkey. In 1816 he took charge of the army in Arabia and in the course of three years overthrew the Wahhabi power in western Arabia and in Nejd. During the War of Greek Independence he was dispatched at the head of a powerful fleet and a finely disciplined land force to the aid of the Turks in the Morea. In 1825 he stormed Navarino and Tripolizza and in the following year took Missolonghi after a long siege. The destruction of the Turkish-Egyptian fleet in the harbor of Navarino (qv), Oct 20, 1827, and the landing of a French force, led to the evacuation of the Morea by Ibrahim

in September of the following year. As the result of a dispute with the Pasha of Acre, an Egyptian army under Ibrahim invaded Syria in 1831, stormed Acre, May 27, 1832, and defeated the Turkish forces at Homs, Beilan, and Konieh. By the Treaty of Kutayah, May 6, 1833, Mehemet Ali received possession of Syria, while Ibrahim was made Governor of Cilicia. War with the Porte broke out again in 1839, and on June 24 of that year Ibrahim overwhelmed the Turkish army at Nisib, near the Euphrates. Only the interference of the Great Powers saved the Porte from the victorious armies of Mehemet Ali. Ibrahim was forced to evacuate Syria in 1840 and to return to Egypt, suffering the most severe hardships on his march through the desert. He died at Cairo, Nov. 10, 1848, after acting for some months as Regent during the incapacity of Mehemet Ali. His son, Ismail Pasha (qv), subsequently became Khedive of Egypt.

IBRAIL, ē-bra'el. See BRAILA.

IBSAMBUL, ip'sam-būl'. A noted group of ruins on the Nubian Nile. See ABU-SIMBEL.

IBSEN, ih'sen, Dan ip'sen, HENRIK (1828-1906). A Norwegian dramatist, who strongly influenced German, French, English, Italian, and Scandinavian literatures. He was born at Skien, March 20, 1828. His great-grandmother was Scotch, his grandmother and mother German, his grandfather's grandfather Danish. They were a family of shipmasters. His father, Knud Ibsen, a merchant, met with reverses in Henrik's boyhood, which compelled the youth to pass six years (1836-42) in great poverty. In the latter years of this period he attended a scientific school at Skien, and late in 1843 he became an apothecary's apprentice at Grimstad, where he remained till 1849, writing a *Catiline*, a drama in four acts (published at Christiania in 1850 under the pseudonym Brynjolf Bjarme, revised ed., 1875), and some poems. He now sought the University of Christiania to study medicine, but in 1850 he was diverted by the successful production at Christiania of his *The Warrior's Mound* from academic studies to the drama. In 1851 he helped to found a short-lived weekly, *The Man* (later called *Andhrumner*), in which appeared his political satire, *Norma*, poems, and critiques. In November he was appointed by the violinist, Ole Bull, stage manager at Bergen, with leave of absence for five months, on a small stipend, to study the art he was to practice. These he spent in Copenhagen and Germany, writing the unsuccessful and unpublished *St John's Night*. In 1856 *The Feast at Solhoug*, the first of his national dramas, was produced in the theatrical centres of Norway and Sweden. It won him enthusiastic applause and national renown. In 1857 he became director of the Norwegian Theatre at Christiania, but five years of his management reduced it to bankruptcy. Here were produced *Lady Inger of Ostråt*, a saga drama (1855), *The Warriors in Helgeland* (1857), and *Love's Comedy* (1862). In this period he wrote also the longest of his minor poems, *On the Mountain Plains* (1860), and the admirable seafaring romance *Terje Viken* (1861). In 1862, after the bankruptcy of the theatre, Ibsen accepted from the university small grants for researches in folklore and in 1863 petitioned the Storting for the poet's pension (about \$450). He received in 1863 a traveling scholarship and the pension in 1866. Meantime, embittered by

delay and the political situation, he left for Rome in April, 1864, whence he sent back (1866) the social satire, *Brand*. In 1868 Ibsen left Rome for Dresden, where he remained till 1874. He visited Munich, Copenhagen, and Stockholm, and in 1869, on invitation of the Khedive, he was present at the festivities on the opening of the Suez Canal, where he wrote the poem *At Port Said*. After a voluntary exile of 10 years he went back to Norway. In 1891 Ibsen made Christiania his home. On his seventieth birthday the poet dramatist received gifts and world-wide greetings. A bronze statue of him was set outside the new National Theatre in September, 1899. He died at Christiania, May 23, 1906.

Besides the dramas above named, Ibsen's works include *The Pretenders* (1864), an historical drama, *Brand* (1866) and *Peer Gynt* (1867), dramatic poems, *The League of Youth*, a political comedy (1869), the bulky twofold historical drama, *Emperor and Galilean* (1873), and, beginning with 1877, the yet better-known series of dramas that are more characteristic of what passes for Ibsenism: *The Pillars of Society* (1877), *A Doll's House* (1879), *Ghosts* (1881), *An Enemy of the People* (1882), *The Wild Duck* (1884), *Rosmersholm* (1886), *The Lady from the Sea* (1888), *Hedda Gabler* (1890), *The Master-Builder* (1892), *Little Eyolf* (1894), *John Gabriel Borkman* (1896), *When we Dead Awaken* (1900). Ibsen's dramatic work had been at first romantic. This phase culminated in *The Feast at Solhoug*. Then it was historic, but still romantic, up to the *Warriors in Helgeland*. Next the psychological interest becomes prominent, and with it a tendency to social satire very marked in *Love's Comedy*, a masterpiece of swift action and of biting irony. The dramas from 1864 to 1867 are polemically national rather than social. *The League of Youth* marks the transition from political to social interests. From this time on Ibsen is a pathologist of social ills, dealing with conditions which are universal to modern life and thus winning an ever-widening cosmopolitan audience. The best edition of Ibsen in English is *Collected Works* (13 vols., New York and London, 1909-12), revised, edited, and in part translated, by William Archer, the English dramatic critic. William Archer, be it said, began as early as 1878 to be Ibsen's apologist, and he continued his stout and victorious champion. He had for years to face a band of critics as hidebound as the critics in Ibsen's own country had shown themselves, whose unreasoned violence and virulence were amazing. English dramatic literature is deep in the debt of Mr. Archer for the new inspiration and new point of view, giving rise to a new school of dramatists, that followed the ultimate acceptance of Ibsen's work in England, as it is in the debt of Bernard Shaw, whose free-lance championship of Ibsen, in *The Quincentessence of Ibsenism* (1893, and, completed to Ibsen's death, 1913) and in a shower of brilliant dramatic criticisms, put him in the front rank of the champions of the Scandinavian drama of ideas who were soon to triumph. By some Ibsen's work was assailed as immoral, cynical, pessimistic, unfit to be seen or read, by others it was hailed as a new gospel of truth and emancipation. It is not wholly either. The plays are studies in human responsibility under modern social conditions, which in many points Ibsen considers danger-

ously diseased and as threatening the whole body with a gangrene. So he has become the poet of protest, the unveiler of sophistries, the scourger of hypocrites. He writes of vice, but it is with loathing. He lays bare the cause of evils, but leaves it to others to prescribe the remedy.

Leaving the moral question aside, these social dramas mark a new stage in the evolution of dramatic art. They are dramas of descending, not ascending action—not of preludes, but of consequences. The plays are thoroughly realistic, absolutely unconventional. Their dialogues are so natural as to give the illusion of real though fascinating conversation which the playwright allows his audience to overhear. It would be hard to match them in any literature. Hence their power has been felt throughout the dramatic and literary world, while the realistic dramas of the French naturalistic school, of the Goncourts and Zola, have been regarded with languid curiosity as the products of artistic theory. Ibsen's influence has not been so widespread in the United States, however, as in Europe. The editions of his works are very many, but the final and standard text is found in his *Complete Works (Samlede Verker)*, with bibliography by J. B. Halvorsen (10 vols., Copenhagen, 1898–1902). Ibsen's writings are translated into most languages of the civilized world. For Ibsen's life and writings, consult Brandes, *Ibsen, Bjornson* (New York, 1882), Wicksteed, *Four Lectures on Ibsen* (ib., 1892), Jaeger, *Henrik Ibsen. A Critical Biography* (Chicago, 1894), Boyesen, *Commentary on the Writings of Henrik Ibsen* (New York, 1894), G. Grau, *Henrik Ibsen, 1828–98* (Bergen, 1898), Archer, "The Real Ibsen," in *International Monthly* (London, 1901), *Letters*, translated by Laurvik and Morison (New York, 1905), Wagner, *Henrik Ibsen* (Copenhagen, 1907), E. Gosse, *Life of Henrik Ibsen* (London, 1908), J. Bing, *Henrik Ibsen* (Copenhagen, 1909), *Efterladte Skæfter* (3 vols., Christiania, 1909), L. C. Nielsen, *Mundskrift over Ibsen's Forlægger, Fr. Hegel*, with letters (Copenhagen, 1909, 1st ed., 1913), Shaw, *Quintessence of Ibsenism* (New York, 1909); O. Heller, *Ibsen. Plays and Problems* (Boston, 1912), H. Rose, *Ibsen. Poet, Mystic, and Dramatist* (New York, 1913). Consult also the bibliographical appendix to Ibsen's *Speeches and New Letters* (Boston, 1910).

The German Ibsen literature, native and translated, is very extensive, among the more noteworthy and recent contributions to it are *Samtliche Werke*, by Brandes, Schlenther, Elias, and Koht, with letters (10 vols., Berlin, 1898–1904), Brahm, *H. Ibsen* (ib., 1887), Andreas-Salomé, *Ibsens Frauengestalten* (ib., 1892), Woerner, *Ibsens Jugenddramen* (Munich, 1895), and *H. Ibsen* (2 vols., Munich, 1900–10, 2d ed., 1911), Jager, *H. Ibsen* (Swedish, Christiania, 1892, German, Dresden, 1897), Von Hausten, *Ibsen als Idealist* (Leipzig, 1897), Garde, *Der Grundgedanke in Ibsens Dichtung*, translated by Kuchler (Leipzig, 1898), Brandes, *H. Ibsen* (Copenhagen, 1898), Reich, *Ibsens Dramen*, (6th ed., Dresden, 1908), Litzmann, *Ibsens Dramen* (Hamburg, 1901).

IBSEN, SIGURD (1859–). A Norwegian statesman and journalist, born at Christiania, a son of the dramatist Henrik Ibsen. From 1864 to 1884 he lived abroad with his parents, was educated at Rome and Munich, entered the diplomatic service in 1885, acted as attaché at

Stockholm, Washington, and Vienna, but retired in 1889. He was on the staff of the *Nyt Tidsskrift* in 1892–95 and in 1898–99 edited the *Kunsten*. In the latter year he received a post in the Ministry of the Interior, in 1902 became a member of the State Council in Session at Stockholm, and in October, 1903, was appointed Minister of State at Stockholm in the Hagerup cabinet, going out of office in March, 1905. He was in favor of a friendly adjustment of the differences between Sweden and Norway. He married a daughter of Bjornstjerne Bjornson (qv). In 1906 he was appointed a member of The Hague Tribunal and in 1912 was reappointed. He wrote *Menneskelig Kvintessens*, essays (1911, Eng. trans., New York, 1912), and a drama, *Robert Frank* (1914, Ger and Eng. trans., 1914).

IBYCUS, ἰβύκιος (Lat., from Gk. ἰβυκος, *Ibykos*). A Greek lyric poet of the sixth century B.C., born at Rhegium in Italy. He lived the life of a wandering minstrel and passed some time at the court of Polycrates, the tyrant of Samos. The story of his death near Corinth, at the hands of robbers, and of the detection of his murderers by means of a flock of cranes (see Plutarch, *De Garrulitate*, xiv), which has been so beautifully told by Schiller in *Die Kranche des Ibykus*, is based on a similarity between the name of the poet and the Greek word ἰβυξ (a crane). The poet, when dying, called on a flock of cranes to avenge his death, later, one of the robbers, when they were all in the theatre at Corinth, seeing cranes hovering overhead, betrayed himself and his comrades by crying, "Behold the avengers of Ibycus." Of his erotic poems, which celebrated the charms of beautiful lads and lasses, the extant fragments are published by Schneidewin, *Ibyci Rhegini Carminum Reliquæ* (Göttingen, 1833), and in Bergk, *Poetæ Lyrici Græci*, iii (Leipzig, 1882). Consult also Smyth, *Greek Metric Poets* (London, 1900).

ICA, ē'ka. A maritime department of Peru, bounded by the departments of Lima and Huancavelica on the north, Ayacucho on the east, Arequipa on the southeast, and the Pacific on the southwest (Map: Colombia, B 6). Its area is 8620 square miles. The surface is of varied formation. The eastern part is mountainous, the western is lower and traversed by ridges of low hills. The climate is hot and dry, and the soil, with the exception of the valleys, is thin. The vine and sugar cane are cultivated extensively, corn, cotton, and indigo are also raised. The mineral wealth consists of gold, copper, and iron. Wine and alcohol are produced, and sugar refining is carried on. The population was officially estimated, in 1896, at 90,962. Capital, Ica.

ICA. The capital of the Peruvian department of the same name, situated on the river Ica, 46 miles by rail from Pisco on the coast (Map: Colombia, B 6). It manufactures wine and brandy. It was founded in 1563 and has suffered greatly from earthquakes. Pop., estimated at 10,000.

IQÁ, ē-sa', or **PUTUMAYO**, pū'tū-ma'yō. An important tributary of the Amazon. It rises in the Colombian Andes and flows southeasterly in a very tortuous course, joining the Amazon near San Antonio (Map: Colombia, C 4). Its total length is about 1000 miles, and it is navigable during the rainy season for nearly 900 miles. The region through which it flows

is very sparsely inhabited and covered mostly with thick forests. The Içá was partly explored in 1878-79. The territory along the middle course of the Putumayo is in dispute between Peru and Colombia. Here occurred the abuses against the Indians employed in rubber gathering, which were brought to light in 1911-12.

ICARIA, i-ká'ri-á (Lat., from Gk. *Ἰκάρια*, *Ikaria*). A deme of Attica, where excavations were carried on by the American School at Athens in 1888, when many interesting remains were found. Icaria is noted as the birthplace of Thespis, and as the spot to which legend assigns the introduction of wine making and of the cult of Dionysus by the god himself.

ICARIA. An island of the Aegean. See **NICARIA**.

ICARIANS, i-ká'ri-anz. Members of a communistic society, founded by Cabet (qv) to realize the ideals set forth in his romance *Voyage en Icarie*. During the years preceding the revolution of 1848 communistic doctrines had a wide following in France, and when, in 1847, Cabet announced the acquisition of land in Texas, a large number of persons agreed to emigrate with him to found a settlement there. In 1848, 69 persons set out for the colony, but were unable to endure the climate and returned after a few months to New Orleans, where they were joined by Cabet with 400 more. Early the following year Cabet, with about 300 followers, emigrated to Nauvoo, Ill., then recently deserted by the Mormons, where the colony was moderately prosperous for a few years, undertaking agriculture as well as trades and manufactures. Dissensions arose, and in 1856 Cabet was expelled together with those members of the community who supported him. In 1860 financial difficulties rendered it necessary for the remaining Icarians to abandon Nauvoo, and 35 of them founded a new settlement in western Iowa. For 20 years they grew in wealth and numbers, but in 1880 the community split into two factions, the Young and the Old Party. The former soon broke up, the latter existed until 1895, when it, too, was dissolved. In 1881 a few members of the Iowa community went to California, where they established Icaria Speranza—a society, however, more like a business corporation than a communistic settlement.

The organization of the Icarian communities was democratic. Directors were elected, but they could only execute the orders of the whole body. The members lived in little houses around a central hall where they took their meals in common. The Icarian settlements were the most successful of the communistic experiments of the early nineteenth century. Consult Shaw, *Icaria* (New York, 1884), and Lux, *Etienne Cabet und der ikarische Kommunismus* (Stuttgart, 1894).

ICARIUS (Lat., from Gk. *Ἰκάριος*, *Ikarios*). 1. In Greek mythology, an Athenian to whom Dionysus taught the cultivation of the vine. After him the deme Icaria (qv) was named. 2. The father of Penelope, wife of Odysseus.

ICARUS. See **DÆDALUS**.

ICAZBALCETA, é'kas-bal-sá'ta, JOAQUÍN GARCÍA (1825-94). A Mexican author. He was born in the city of Mexico. His first literary work was the contribution of biographical sketches to the *Diccionario universal de historia y geografía*, and he afterward edited and published a *Colección de documentos para la his-*

toria de México (1858-66), *Historia eclesiástica indiana, obra escrita a fines del siglo XVI por Francisco Gerónimo Mendieta de la orden de San Francisco* (1870), and *Nueva colección de documentos para la historia de México* (1886-92). He also prepared the *Bibliografía Méxicana del siglo XVI*, a monumental work, and wrote *Don Fray Juan de Zumarraga* (1881), a biography of the first Bishop and Archbishop of Mexico.

ICE (AS, OHG *is*, Ger *Eis*). Water in the solid state, usually crystallized in the hexagonal system. Ordinarily the crystalline structure of a block of ice is not apparent, owing to the close contact and perfectly regular arrangement of the crystals. But when a piece of ice is exposed to radiation from any luminous source, as the sun, a glowing fire, a gas or oil flame, disintegration gradually takes place, and by the use of a lens numerous small crystals may be seen studding the interior of the block, as the heat continues, these crystals expand and finally assume the shape of six-rayed stars of exquisite beauty (See **SNOW**). The freezing point of pure water is marked 0° on the Centigrade and Réaumur scales, and 32° on the Fahrenheit scale. The influence of changes of pressure on the freezing point is so slight that for all ordinary atmospheric pressures the freezing point of pure water may be considered a constant quantity. Great pressures, however, have the effect of lowering the freezing point very considerably. Thus, according to Tamman, under a pressure of 615 kilograms per square centimeter water freezes at -5° C (+23° F), and under a pressure of 1238 kilograms per square centimeter it freezes at -10° C (+14° F), and still greater pressure lowers the freezing point still further (See **MELTING POINT**). This phenomenon is connected with the fact that ordinary ice is lighter than water. In nearly all other cases the solid form of a substance is heavier than the liquid form of the same substance, and in all such cases pressure *raises* the freezing point. Even in the case of water it is only ordinary ice, or, as it is denoted, Ice I, that is lighter than water. In recent years Tamman and Bridgman have obtained several new modifications of solid water, called Ice II, Ice III, etc., whose specific gravity is greater than that of liquid water and whose melting point therefore *raises* with increase of pressure. These new modifications of ice can exist only at low temperatures and under high pressures. See **PHASE RULE**.

By cooling pure and clear water cautiously, it may be "undercooled," i.e., it may, under ordinary pressure, be obtained in the liquid state at temperatures several degrees below its normal freezing point. But this is quite different from the effect of high pressures, the state of "undercooled" water is just as unstable as the state of a "supersaturated" solution, and a slight disturbance may cause the whole mass to freeze very rapidly, just as it may cause rapid crystallization to take place in a supersaturated solution. The lowering of the freezing point by pressure has furnished one of the theories explaining the motion of glaciers. This "regelation theory" is illustrated by the following phenomenon. If a wire holding heavy weights at its ends is thrown over a block of ordinary ice, it gradually cuts its way through the block, and yet the latter remains entire. Along the line where the wire presses upon the block the melting point is lowered, and hence the ice melts

and allows the wire to descend through a minute distance, the water immediately above the wire then freezes, because it is freed from pressure, and next the ice immediately below the wire melts, allowing the wire to descend a little farther. Thus melting and almost immediate regelation proceed until the wire has cut through the block.

The freezing point of water, as that of any other liquid, is considerably lowered by dissolving in it substances of any kind, and sea water, on account of its salt, is found to freeze at -2.5° to -3.0° C (27.5° to 26.6° F). The solid separating out, under ordinary circumstances, from freezing sea water is not a mixture of ice and salt, but pure ice, and this fact has been utilized in two ways: (1) for concentrating brine in the manufacture of salt, (2) for obtaining sweet drinking water from the salt water of the sea.

Ice, having a lower specific gravity than water, floats on its surface. The specific gravity of ordinary ice at 0° C is 0.918. The specific heat of ice, i.e., the amount of heat required to raise its temperature 1° C, is much less than that of water in the liquid state, within 30° C below the freezing point it is very near one-half, and at lower temperatures it is even somewhat less than one-half, that of water. In the process of melting, ice absorbs more heat than any other solid (see FREEZING MIXTURES), more than 80 calories being required to melt 1 gram of ice, the same amount of heat would raise the temperature of the gram of melted water to 80° C (176° F).

Arctic Ice. The entire Arctic Ocean is practically covered by permanent heavy ice, or ice pack, throughout the year, though the heat of summer reduces the thickness of the main body of the pack and so facilitates the formation of leads, or open water spaces. While the average thickness of the ice cannot exceed 6 or 7 feet, yet through pressure and underrunning it attains or exceeds 30 feet in places. The average maximum thickness of sea ice in Arctic America, as determined from observations of 18 years, at 15 different and widely separated land stations, was but 76 inches. Moss and Greely have shown conclusively that the very heavy, thick floes of the pack, originally thought to be of oceanic origin, are detached parts of glaciers. Separate heavy floes, colliding under great force, break up their edge into small fragments called *rubble*, which often form enormous and extended heaps along the floe edge and are known as *pressure ridges*. The sea ice forming against the land, and adhering thereto despite the rise and fall of the main sea floe with the tides, is called an *ice foot*.

As there are 1,000,000 square miles of unknown areas within the confines of the Arctic Ocean, it is impossible to fully describe the movements of the whole of the oceanic pack. It is known, however, that the pack to the north of Bering Strait, through the action of the currents and prevailing winds, drifts west-northwesterly to the neighborhood of the pole north of the Franz Josef Archipelago, whence the drift turns southwesterly towards Jan Mayen. Except the discharge of a large and yet very inconsiderable amount of Arctic ice into the Atlantic Ocean, through the Greenland Sea, no ice of any amount emerges from the Arctic Ocean. The pack of Baffin Bay is in large degree stationary, though it divides in

summer into three distinct masses, known as the North, the Middle, and the South Ice, the last-named, extending into Davis Strait, becomes navigable in late summer. The ice of Kara Sea similarly divides, but irregularly and with less possibility of navigation. The pack of Barents Sea, affected by a northeasterly current, tends to coalesce with the main pack of the Arctic Ocean. The southerly limit of the Arctic sea ice trends south-southwesterly from about 65° of north latitude, east of Iceland to the forty-fifth parallel on the Banks of Newfoundland. Along the Arctic coasts of America, Asia, and Europe, there are formed in summer wide shore belts of ice-free sea, varying largely in size according to the season, they are largely due to the influence of the fresh-water discharge from continental rivers.

Antarctic Ice. South-polar ice conditions strikingly contrast with those of the Arctic zone. The very extended Arctic Ocean is permanently covered with ice, of which 99 per cent remains in the vicinity of its formation. In the south the vast continent of Antarctica, with its periphery of 10,000 miles or more, is fringed with a belt of annual formation of sea ice several hundred miles wide in its northerly extensions. Usually the Antarctic pack drifts northerly, leaving a wide belt of nearly ice-free sea along the continental shelf. The pack does not attain the thickness of that of the Arctic Ocean. It drifts largely into the Temperate zone and disintegrates freely to the north of the Antarctic circle. While its northern limits vary with the seasons and are not definitely determined save for small areas, it has been known to reach the forty-eighth degree of south latitude before entirely melting.

Icebergs. This name is given to sections of glaciers which have become detached from the main body of glacial ice after its front, or snout, has reached a sea or lake. Fresh-water bergs are of rare occurrence and of inferior size. Main interest attaches to oceanic icebergs, which have their birth as offshoots of the glacial caps of lands of considerable area. Such Arctic lands are Greenland, Northeast Land, portions of Grinnell Land, of Spitzbergen, and of Jan Mayen, which are productive of bergs in the order named. To these Greely, supported by Harris, adds a hypothetical land to the northwest of Parry Archipelago. Of the regions named, Greenland is preeminent for the number and the size of the bergs which drift into Atlantic waters. While the most extensive and remarkable of the *live* glaciers—those terminating in the sea—are those debouching into the Greenland Sea from the east Greenland coast, yet the conditions of currents and of winds are such that very few of these icebergs reach the open Atlantic Ocean. The greater number of the bergs of the Atlantic come from Disco Bay, with its wonderful and contributing fiords of Jacobshavn, Torsutakak, and Great Karajak, then follow in importance Umnak Fiord, 71° N, and Angpadlartok (near Upernivik), 73° N. The glaciers of Melville Bay, Kane Sea, Smith Sound, and east Greenland (by drift around Cape Farewell and thence north) together add somewhat to the long procession of icebergs which, collected by currents in about 73° N, skirt the western shores of Baffin Bay in their southward march into the Atlantic waters adjacent to Newfoundland.

The Greenland bergs are occasionally of great

size Large icebergs tower from 100 to 250 feet above the ocean, which makes their entire height from 700 feet to about 1600, as about one-seventh is above water. Dr. Hayes reports one as rising over 300 feet above the sea, but it was not carefully measured. In Kennedy Channel Greely followed a floeberg (a low tabular iceberg) which was 15 miles long, over 100 feet thick, and of unknown breadth. In the Atlantic Ocean the southern limit of icebergs extends from lat 60°, southeast of Iceland, in a south-southwesterly direction to about 45° N, off the Banks of Newfoundland. In 1842 an Atlantic berg, it is said, was recorded in 38° 40' N. lat.

It is in the south-polar regions, however, that are found icebergs in the greatest numbers and of maximum size. Their annual accretions must run into hundreds of thousands, for glacial-capped Antarctica, with its more than 10,000 miles of icy coasts, does not, so far as is known, present 100 consecutive miles of shore free from discharging glaciers. Besides the thousands of miles of live glaciers on land, another very prolific source of bergs is Ross Barrier. This is an oceanic ice cap, extending through more than 28° of longitude, nearly 600 miles, with a sea face of solid ice rising from 80 to 250 feet above the ocean. The Antarctic icebergs are almost always tabular, flat-topped, with perpendicular sides, which often rise 200 feet or more above the water. Their size is more astounding than their height. Dr. Bruce observed one more than 30 miles in length and of unknown breadth. Two different ships reported another berg, which was more than 40 miles in length, and which must have had more than 1000 miles of surface area. Most of these bergs drift north and melt between lat 40° and 50° S. They are frequently seen in the neighborhood of Cape of Good Hope, and one was reported in lat 26° 30' N, long 30° 36' W, within a few hundred miles of Rio de Janeiro.

ICE, LAW OF. After ice has been harvested it is personality and is subject to the rules of law governing that form of property. Before it is harvested it is deemed realty for most purposes, although a contract for the sale of all the ice on a certain pond is treated as a contract for the sale of a chattel and not of an interest in real estate.

If the land beneath a particular body of water, whether stream or lake, is subject to private ownership, the ice that forms on the water belongs to the owner of such land, and he has exclusive authority to gather and dispose of it. Hence a lease of the land or a conveyance of the fee carries to the tenant or to the grantee the ownership of the ice which forms during the term of the lease, or which exists at the date of the conveyance. It is in the nature of an accession to the land, being an increment arising from a formation over it, and is a part of the real estate under the rule that the ownership thereof extends indefinitely upward from

the soil. The landowner may grant to another the right to take ice from private waters, as a profit à prendre, i.e., as a right to take the products or proceeds of land.

A riparian owner's right to ice on navigable rivers depends upon his ownership of the land under them. In States where the fee of such rivers is vested in the public the adjoining landowner has no title to the ice, and it belongs to the first appropriator. In other States, where riparian owners are accorded title to the land under navigable waters, they can maintain trespass against any one taking the ice without their consent. At times ice-covered streams or lakes are used as highways of travel and the question has arisen whether the harvesting of ice upon such a thoroughfare amounts to a nuisance, as an unlawful obstruction to travel. The courts have given this answer. In the absence of legislation on the subject, the right of travel and the right of harvesting ice on navigable waters are public and are to be exercised reasonably. What is a reasonable use of either right depends upon the relative benefits to the community from its exercise. If the privilege of harvesting ice is deemed of greater importance than that of traveling upon it, the latter cannot be set up to prevent or abridge the exercise of the former.

The right to harvest ice forming upon public waters is not private, but public or common. Any person may enter such ice fields and take what he pleases, so long as he does not unlawfully interfere with the like right of others. What acts amount to an appropriation of ice on public waters is a question upon which the courts are not agreed. One view is that an appropriation is made by marking and staking off a plot of ice and preparing the surface for cutting. The other view is that a person does not gain any property rights in such a plot of ice until he has actually reduced it to possession. The subject is regulated in some States by statute. Consult Gould, *The Law of Waters, Including Riparian Rights* (Chicago, 1900); Coulson and Forbes, *The Law Relating to Waters* (London, 1902), and the statutes of the various States.

ICE AGE. See GLACIAL PERIOD; PLEISTOCENE PERIOD.

ICE BEAR. The polar bear. See BEAR.

ICE-BERG. See ICE.

ICE-BREAKING STEAMER. A vessel used for keeping open a navigable passage through ice. Such vessels are much used on the Great Lakes of the United States, where they are usually adapted for carrying cargoes or railway cars. They are very heavily built to stand the shock of ramming the ice or of running up on it at the bow and breaking it by reason of their weight. (See FERRY.) During many years the problem of constructing such vessels was studied by Admiral Makaroff, of the Russian navy, and several vessels were built from his designs. The largest of these was built in England in 1898-99, and is called the *Yermak*. She is of 8000 tons' displacement and has four screws, one under the overhanging bow to suck down the ice, so that the bow will ride over it and, descending, crush it. This screw also creates a current which drives the broken ice astern. The stern is recessed to receive the bow of a vessel following her through the channel which she makes. Her length is 305 feet, beam, 71 feet; and draft, 25

feet The coal capacity is very great—3000 tons—as it was intended to use her in Arctic exploration, she spent some months in the Arctic Ocean during the summer of 1900 and was very successful in breaking her way through ice fields in harbors, but in 1901, against the heavy ice of the polar pack, she proved inefficient During the past year (1914-15) heavy gyroscopes have been mounted on ice-breaking steamers for the purpose of making them roll and thereby add to their efficiency The preliminary experiments have been successful, and it is likely that ice breakers will hereafter be fitted with devices of this kind See FERRY

ICE CAVE Any natural formation of ice in a cave or crevice The walls of caves often become cooled to such a point by the infiltration of cold air in winter or during the frosty nights of spring and autumn that the percolating waters rapidly freeze The ice usually disappears for a few weeks in September The most celebrated ice cave in the world is that of Dobschau (Dobsina) in Hungary, situated in the Carpathians, at an elevation of about 2700 feet Consult Balch, *Glaciers or Freezing Caverns* (Philadelphia, 1900)

ICE COLUMNS See FROST

ICE GULL. A name given to several gulls encountered by sailors in icy regions, most properly perhaps to Ross's gull See GULL

ICE INDUSTRY, THE The ice industry is divided into two branches, in accordance with the origin of the ice itself *Natural ice* is cut in winter from rivers, lakes, and ponds, stored in ice houses, and distributed to consumers as needed *Manufactured ice*—or, as it is more commonly called, *artificial ice*—is produced when and where required and is generally distributed with comparatively little intervening storage The collection and preservation of ice and snow, on a scale which was small indeed as compared with the operations of the present day, appear to have been practiced from early times by most civilized nations having the natural products within their reach Where neither snow nor ice was provided by nature, various means of artificial production have been practiced in a small way for centuries, such as the exposure of water in porous receptacles, and packing common or some other kind of salt about vessels containing water But the modern ice industry began in the United States early in the nineteenth century, with the transportation of ice in sailing ships from cold northern to warm southern ports, and the production and sale of manufactured ice has attained large proportions and made an ample and cheap ice supply quite independent of local temperatures

Natural Ice It is said that both the Greeks and the Romans packed snow in deep underground pits, and that Nero established ice houses in Rome At the end of the seventeenth century dealers in ice and snow were quite common in France In 1799 a cargo of ice, cut from a pond near Canal Street in New York City, was shipped to Charleston, S C This may be considered as of little moment, but in the winter of 1805-06 Frederick Tudor, of Boston, Mass, entered the ice field in good earnest and after some heavy losses succeeded in establishing an export trade in ice which was the beginning of the modern industry Tudor's first ice cargo, of 130 tons, was shipped from Boston to Martinique in the winter of 1805-06, but though the ice reached its destination in safety,

the venture resulted in a loss Two years later a shipment of 240 tons to Havana, Cuba, also resulted in a loss to Tudor A monopoly of the ice trade with the British West Indies was secured by Tudor about 1816, and a like privilege from Spain in 1815-16 From 1815 to 1820 the same merchant extended his ice trade to Charleston, S C, Savannah, Ga., and New Orleans, La Others followed his example, until in 1855 ice exports from the United States, according to statistics of the Treasury Department, amounted to 41,117 tons, valued at \$190,793 These exports increased to 68,802 tons, valued at \$267,702, in 1870, after which time they decreased until in 1900 the tonnage was 13,720 and its value \$29,501, while in 1913, 7979 tons, valued at \$31,751, were exported The foreign ice trade was soon outstripped by the domestic commerce in what had long since changed from a luxury to a necessity Published figures for the harvest of Maine and Hudson River ice showed that those two sources alone produced yearly quantities ranging from 2,226,000 tons in 1880 to 5,626,430 tons in 1899 The capacity of Hudson River district ice houses in 1902 reached a maximum, being placed at 4,833,100 tons, of which 4,606,800 tons actually were housed, but this capacity declined steadily and in 1914 was 3,226,086 tons, while 1,938,149 tons actually were harvested This total capacity in recent years has been rarely utilized, the deficiency in the amount of ice housed sometimes reaching as much as 65 6 per cent (1913) The house capacity of the natural-ice business in the United States in 1914 was estimated at 30,000,000 tons, valued at \$75,000,000, and the real estate valued at \$60,000,000 It should be remembered, further, that in the aggregate the additional harvest for private purposes is immense

Harvesting Ice is a comparatively simple operation, or series of operations, the main features of which are as follows The snow, if any, lying on the ice is removed by scrapers, as is also any contamination of the top surface In case there is an upper layer of snow ice, it is loosened by field planes and then removed Markers are next used to outline the blocks, which are followed by plows, which cut the grooves still deeper The scrapers, planes, markers, and plows are drawn by horses or mules The parallel grooves, it should be understood, are first cut in one direction, then another series is cut at right angles to the first The final grooves extend nearly through the ice, so that the cakes may readily be pried apart by means of suitable tools When the latter operation has been effected, the cakes are floated to the shore through channels provided for the purpose, and there elevators, generally inclined, lift the ice to the ice houses Dirty and broken cakes are rejected, and in some houses the cakes are planed to nearly uniform thickness on the elevators The cakes are packed close together, with sawdust or other insulating material above the final layer, and between the ice and the outer walls of the ice house, the idea being to eliminate melting as much as possible The ice houses are generally tall structures, with outer walls composed of one to three compartments filled with insulating materials Once the most approved plan was to have an outer compartment in which the air was allowed to circulate An inner or dead-air compartment is usually found, but some authorities recommend that this

also should be packed with sawdust or shavings as well as a central space packed tightly with the same material. Now the elimination of air is considered desirable, and the ice should be piled very high. The bottom of the ice house

FIG. 1. ICE TOOLS

should have tight and well-constructed foundations going down below frost and must be well drained, while the roof should be not only watertight but as well insulated as the walls, and movable covers for the ice are also recommended. Recent experiments have shown that an efficient and economical ice house that is also fireproof may be made of glazed terra-cotta tile in two walls 10 inches apart with mineral wool or cork between. Railway sidings or docks, or both, afford means for shipping the ice to dis-

FIG. 2. ICE TOOLS.

tributing centres. Specially constructed cars, with lined sides and bottoms, are used where ice is to be shipped long distances, and in the South the cakes are carefully packed in addition.

Besides the ice tools already named (snow scraper, ice plane, marker, and plow) the follow-

ing may be mentioned: augers and tapping axes, for inspecting the ice and for draining it of surface water; saws; forked and pronged and chisel and needle bars, for separating the cakes after the markers and plows have done their work; trimmer bars, for squaring the cakes; hooks, grapples, and forks, for pushing them to the elevator; chain scoop nets and sieve shovels, for removing slush ice from the channels; hoisting, drag, and edging tongs, adzes and long-handled chisels, for packing the ice in the

FIG. 3. ICE TOOLS.

houses; saws and bars, for loosening the ice preparatory to shipment from the houses; and, finally, delivery wagons, tongs, saws, axes, shaves, and scales.

Artificial Ice. A sketch of the development of ice-making apparatus and descriptions of the principles and practices involved will be found under REFRIGERATION. The following figures regarding the growth of the industry in this country are taken from the section on the Manufactured Ice Industry in the Thirteenth Census of the United States (Manufactures, 1913). The first ice factory of importance in this country was erected at New Orleans in 1866. In 1870 three other factories located in Southern States were included in the census returns. The number of establishments reported increased to 35 in 1879, 222 in 1889, 775 in 1899, and 2004 in 1909. The total capital invested in these 2004 plants was \$118,641,538, and the value of the products, which aggregated 12,647,949 tons, was \$42,953,055 against \$13,874,513 in 1899. An unofficial estimate for 1914 places the number of ice factories at 3500, their yearly output at 18,000,000 tons, valued at \$45,000,000, their daily capacity 135,000 tons, and the total investment some \$150,000,000.

These figures, like those previously given for natural ice, do not include the hundreds of plants making ice exclusively for their own use, such as breweries and cold-storage houses. Of

the 2004 plants reported in 1909, 1616 used the compressor and 357 the absorption system (see REFRIGERATION), while 31 used both systems. In 1899 the total product of the 775 factories was 4,294,439 tons, of which 4,139,764 tons, or 96.4 per cent, were can ice and only 154,675 tons plate ice. In 1909 the product of the 2004 establishments was 12,647,949 tons, of which 11,671,547 tons (92.3 per cent) were can ice and 976,402 tons (7.7 per cent) were plate ice. The Middle States produced more ice than any other group, the amount being 1,574,980 tons, as compared with 1,414,158 tons for the Southern States, and only 40,059 tons for the New England States. The average value of the ice at the plants for the whole country in 1899 was \$3.11 per ton for can ice and \$2.85 for plate ice. In 1909 the average value was \$3.15, ranging from \$2.33 in Missouri to \$4.70 in Texas, \$5.26 in Oregon, and \$6.08 in Idaho. As a rule, the Southern States now depend wholly upon the manufactured product for their ice supply. Texas in 1909 ranked second among the States in the value of the product. As one goes farther north, natural ice comes more and more into competition with the manufactured article, until at the extreme north it actually or practically displaces the latter, no establishments for its manufacture, e.g., being reported to the Thirteenth Census for Maine, New Hampshire, Minnesota, North Dakota, South Dakota, Montana, or Wyoming. But the use of manufactured ice has increased rapidly of late and is continually extending towards the north.

Sanitary Aspects. The sanitary quality of ice supplies depends chiefly upon the presence or absence of disease germs, chiefly those of typhoid fever, in the original water, and upon the effect of freezing upon such germs. In addition there is the possibility that manufactured ice may become contaminated during the freezing process by sick or careless workmen, and that any ice may be fouled while it is being distributed to consumers. Proper washing of ice before delivery and domestic use, care not to bring ice in contact with food or water, and proper supervision of ice factories, would go far towards preventing danger from what may be termed incidental contamination. The water from which artificial ice is made is frequently distilled or filtered, or both. In general, it may be said that artificial ice should be made from none but naturally pure water or from that which has been purified, and that natural ice should not be harvested from polluted streams or lakes. It may be noted, however, that natural ice, when formed in fairly deep and quiet water, eliminates much of the impurities while freezing, and that recent bacterial studies show that after a few weeks practically all bacteria, and particularly the dangerous ones, disappear. In other words, the effect of storage is advantageous in tending to cause germs to perish. Under anything like carefully guarded conditions, therefore, the chance of typhoid infection by means of ice is small. In the case of artificial ice the freezing process, being from the outside in, concentrates the impurities at and near the centre of the cake.

ICE/LAND An island in the north Atlantic, under the sovereignty of Denmark. Its main area is barely outside the Polar zone, as the Arctic circle intersects the most northerly points of the island. It extends from long 13° 23' to 24° 35' W., while its most southerly limits are in lat 63° 35' N (Map Denmark, F 1). The nearest land is Greenland, about 150 miles to the northwest, while Scotland is 500 miles to the southeast.

Area and Physiography. The area of Iceland has been variously estimated from a minimum of 39,756 to a maximum of 40,497 square miles, of which less than one-half is available for farming and pasturage. The south shores are sandy lowlands, unbroken by bays or harbours, while the rest of the coasts presents a succession of high precipitous cliffs, indented by numerous fiords. On the southwest shore are the harbours easiest accessible to shipping. It has been appropriately termed the contrasting land of fire and ice, of volcanoes, glaciers, and geysers. The surface in general consists of series of rough plateaus, formed of lava and other eruptive matter. About one-eighth of the land is glacier-hidden. Here and there are large mountain domes, mostly ice-clad—the highest, Öræfajökull, 6424 feet. Fossiliferous strata, especially in the northwest peninsula, of the Tertiary period show that extensive forest areas then existed. Glacial moraines and lava streams have formed numerous depressions, wherein have gathered many lakes. Elsewhere are true crater lakes, the latter class being numerous in the region to the west of the great snow fields of Vanajökull on the southeast coast.

Climate. The subarctic and oceanic situation makes the climate harsh rather than extreme. Southerly-drifting ice besets the northern coasts, making the summer cold, but the northerly ocean currents along the south shore ameliorate the temperature. While the average winter temperatures of the entire coast line vary slightly from 32° F., the summer averages of the north and east shores range from 43° to 44° against 48° to 50° on the south and west coasts.

Fauna and Flora. Few, if any, of the land animals are indigenous. Reindeer were introduced in 1770. Foxes came from ice floes, and rodents from ships. Reptiles and batrachians are absent. Half of the hundred species of birds are aquatic, and among them the eider duck is valued and protected for its down. Walrus and whales are now rare, and seals are steadily decreasing in number. The vegetation is of the Arctic-European type. While there were extensive forests in the Tertiary period, the trees to-day are dwarf beeches, willows, elms, and mountain ash, specimens 30 feet high being rare.

Volcanoes. The island is especially of volcanic origin, as from such activities have been built up the jagged, lava-covered, ice-strewn uplands, averaging 2000 feet or more in elevation, which form nine-tenths of the area of the surface. Magnificent as to scenery, these plateaus

are largely regions of desolation. Practically the only vegetation of the lava slopes is scattered coverings of Iceland moss, which there finds favoring foothold. Indeed the whole land has suffered from volcanic eruptions, of which 25 have occurred within historic times. In all there are more than 100 separate volcanoes, of which the most widely known is Hecla, 5100 feet high, in the extreme southern part. There are thousands of craters, that of Askja with an area of 34 square miles being the largest. Hecla had 18 eruptions in historic times up to 1845, and Katla 13 up to 1860. The eruption of Askja, southwest of Vatna, in 1875 was so violent and long-continued that its ashes reached as far east as Sweden. The most violent and destructive eruption was that of Laki in 1783, which was doubly dangerous from the torrential floods caused through the melting of large glacial masses by the molten lava. An area of not less than 218 square miles was permanently covered by the flowing lava. Enormous regions of pasture and of arable land were devastated, and 80 per cent of the stock—cattle, sheep, and ponies—were killed. Famine conditions, and epidemics arising from volcanic gases, caused more than 9000 persons, about one-fifth of the population, to perish before normal conditions were restored. Including the snow-hidden portions, the present lava fields cover one-fourth of the surface of the island. The largest snow-free lava field, to the north of Vatna, is over 1700 square miles in extent. Largely formed from eruptions of Askja, it has accretions from 19 other volcanoes. Earthquakes of violence have repeatedly occurred and at times have caused enormous damage. Those of 1784 and of 1896 each destroyed many buildings and injured others by the hundreds.

Glaciers. In the Glacial age the island was completely covered with ice. At present there are more than 120 separate glaciers of considerable size, their aggregate areas approximating 5200 square miles. There are very few, if any, living glaciers, though Vatna closely approaches the sea. The location and surface areas in square miles of the largest glaciers are as follows: Vatna, in the southeast, 3280; Hofa, near the centre, 520; Lang, in the west, 500, and Myrdals, in the north centre, 390.

Geysers. Hot springs are numerous throughout several parts of the island, and in the so-called geyser region, about 30 miles northwest of Hecla, there are more than 100 in a small area. The most widely known of them is the Great Geyser, 60 feet in diameter and having an intermittent period of discharge varying at different times from 6 to 30 hours. It throws at times, to the height of 150 feet or more, immense columns of water of temperatures varying from 170° to 190°. One geyser at its bottom depths was found to have water of the temperature of 262° F—possibly the hottest spring in the world.

Agriculture and Other Industries. More than one-half of the inhabitants live by horse, cattle, and sheep raising. A large part of the slopes and river valleys of the plateaus affords excellent pasture for sheep, and in the low-lying lands are extensive meadows, which, properly managed, could support twice the number of cattle that now graze on them. In 1911 the island contained 43,879 horses, 25,982 head of cattle, 574,053 sheep, and 671 goats. A great deal has been done latterly to improve the soil.

Agricultural societies have been formed, and there are now four agricultural schools. At one time a little barley was grown, but it could not be made to pay, and therefore field cultivation has been abandoned. Horticulture, on the other hand, makes great progress, potatoes, cabbages, and rhubarb thrive well, and some berries, such as currants, are cultivated. Woods have never existed since the Glacial period, and the brushwood of birch is less extensive than formerly, owing to the sheep. The birch is seldom higher than a man, though in one place on the east side some specimens attain a height of over 30 feet. The mountain ash reaches the same height. The fishing grounds (cod, herring, flounders, whale, and seal) are frequented by English and French boats. The sea is very stormy, and therefore fishing is best pursued in large and strong vessels. The fishermen of Iceland have had to content themselves with small open boats. They brave the billows of the ocean in winter with the greatest boldness and contempt of danger, and every year many lose their lives. Want of capital has prevented them from acquiring large vessels, but considerable progress has been made in this direction, and the Icelanders now possess a fair fleet of fishing smacks. The fisheries furnish nearly three-fourths of all exports and give employment to about one-sixth of the population. The cod fisheries are among the most important in the world. In 1910 the export of salt cod amounted to 0,753,711 kroner (1 krone = \$0.268). Manufacturing industries, with the exception of cod liver and other fish oil, are utterly absent. The simpler articles of dress and necessaries of life are usually supplied by every native for himself, and the number of artisans is very small. The mineral deposits are not sufficiently large to repay exploitation. Turf is the chief fuel, but some coal is imported.

The chief exports are dried fish, wool, live sheep and horses, eider down, salted meat, butter, hides and skins, cod liver and other fish oil, and whalebone. The annual value of the exports amounts at present to over \$4,000,000. The imports consist of textiles, cereals and other food-stuffs, coal and wood, manufactures of metals, and boats, and have an annual value of between \$3,000,000 and \$3,750,000. In 1911 the imports were valued at \$3,813,622 and the exports at \$4,280,144. The exports to Denmark in 1912 amounted to nearly \$2,000,000 and the imports from Denmark to about \$1,300,000. Up to 1854 the trade of Iceland was a state monopoly of Denmark. Since then it has been free and is now chiefly in the hands of Denmark and Great Britain. Iceland has regular steam communication with Denmark via Leith, the port of Edinburgh. There are a number of trading stations on the island, and six commercial centres. There are few roads. In the settled districts the traveler follows bridle paths worn by the hoofs of the small Iceland horses. A few good roads have recently been built, and some of the streams are being bridged. At the end of 1910 Iceland had 87 telegraph and telephone stations, with 857 miles of line. The people are sturdy and have not allowed the hardships they have endured to crush them. As the farthest outpost of civilization, they have always had to fight a hard battle with nature. They are of an earnest, quiet, and somewhat melancholy disposition, and as a rule very intelligent. Though the lower classes live in poor circumstances, they are very enlightened, perhaps

in no other country of Europe are so many books, in proportion to the population, printed and sold as in Iceland. The island contains several printing establishments, from which issue 18 newspapers besides other periodicals. During recent decades many Icelanders have emigrated to America and have founded flourishing colonies in Manitoba. In all about 15,600 have crossed the Atlantic, but of late years the emigration has fallen off. Besides Reykjavik, the capital, with a population of 11,600 (census of 1910), the chief settlements are Akureyri (2089) and Isafjord (1859).

Government. At the head of the administration is a minister, appointed by the King of Denmark, resident at Reykjavik, and responsible to the Althing for all acts concerning Iceland. The Althing, or the Parliament of the colony, although in existence since the Norwegian occupation, had not attained its full power before 1874, when the new constitution granted by the King of Denmark endowed it with complete legislative authority. The Althing consists of 6 members, of whom 30 are elected by the people and 6 appointed by the crown. It is convened every two years and is divided into two chambers, of which the upper is composed of six elected and the six appointed members, and the lower consists of 24 elected members. The King of Denmark has the nominal right of veto. In 1911 suffrage was extended to women and servants, and the right is now possessed by all competent adults. For purposes of administration the island is divided into three districts—the South, the West, and the North and East—administered by two officials having their seats at Reykjavik and Akureyri. The districts are subdivided into 20 smaller divisions known as syssels and administered by sheriffs, who perform the functions of tax collectors and judges of first instance. At Reykjavik there is a court of second instance for the trial of cases from which appeals are made to the Supreme Court at Copenhagen. The revenue of the country is derived almost entirely from customs and tax on spirits, tobacco, coffee, and sugar. Elementary education is well provided for, and the number of illiterates is remarkably small. There are also a number of higher schools, a theological seminary, a college and a university at Reykjavik, with about 100 students. For religious purposes Iceland forms a separate bishopric in the Lutheran church.

Population. The population, estimated at over 46,000 at the beginning of the nineteenth century, was 72,445 in 1880, 78,470 in 1901, and 85,188 in 1911. The birth rate is large, but it is offset by the large infant mortality resulting from the severity of the climate. The Icelanders are of Norwegian origin and belong exclusively to the Lutheran church. They live mostly on isolated farms, there being very few settlements.

History. Iceland was not visited by Europeans, as far as is known, until the end of the eighth century, when some Celts landed on the island, but its history really dates from about 870, when various Norsemen discovered it, chiefly by accident. One of these, Flóki Vilgerðarson, gave it its present name. Soon thereafter the Norwegians came in large numbers, owing to the despotism of Harald Haarfagi (q.v.) at home, and permanent settlements were made, among them the present capital, Reykjavik. The settlements were all independent of

one another, and for some time the only bond of union was furnished by their common religion, until finally in 927 one Ulfrjotr was sent to Norway to prepare a code of laws. He did so, returning in 930. His constitution provided for a yearly assembly, but all details are lacking to us. Many legal changes, however, had to take place before even a semblance of order prevailed in Iceland. In time regular territorial divisions appeared, and a system of law very similar to that of Anglo-Saxon England. The most important event in the early history of Iceland was the conversion of its inhabitants to Christianity. The first missionary was Thorgeir Kotharson, who came in 981, but after five years left the country, having failed utterly. More successful was the attempt made under the auspices of King Olaf Tryggvason of Norway (995-1000), who introduced Christianity, chiefly by force, about the year 1000. Under the influence of the new religion civilization gradually spread, and the laws became milder. Until 1103 Iceland belonged to the province of the Archbishop of Bremen, later to that of Lund. Meanwhile the kings of Norway regarded Iceland with a jealous eye, for it was a place of refuge for all their rebellious subjects, but all attempts to conquer it failed for many years. The history of the island was mainly one of rivalries of different chiefs, and about the beginning of the twelfth century all the contests in the land were connected with those of the three sons of Sturle—the historian Snorri, Thord, and Sieghvat, the most powerful chiefs of their time. By marriage and other means, Sturle Thordson had become *godar*, or supreme magistrate, of several provinces, for these offices were hereditary in certain families. These offices he transmitted to his sons, who, however, were unable to agree. Finally, in 1262, Norway having been appealed to, King Haakon of that country induced Iceland to join its fortunes to that of Norway. The prosperity of the country from that time onward rapidly declined, as strict navigation laws were enforced. In 1280 Iceland, joined together with Norway, came under the crown of Denmark. This is called the union of the Three Crowns. Much of the subsequent history of the island is filled with the relation of physical evils which desolated the land and effectually subdued the spirit of its inhabitants. Thus, there were repeatedly severe volcanic eruptions, and between 1402 and 1404 the black death swept away, it is said, two-thirds of the population. In 1540 Christian III of Denmark began to introduce into Iceland the Reformation, which rapidly prevailed throughout the whole country. During the Napoleonic wars England captured it, but gave it back to Denmark by the Treaty of Vienna in 1815. The Althing, or Legislative Assembly, was dissolved, but was reorganized in 1843. For many years constitutional conflicts with Denmark went on, which were amicably settled in 1874 by granting home rule to Iceland. In 1903 the ministry for Iceland in the Danish government was transferred to Reykjavik. In 1911 a ministry strongly favoring home rule was chosen.

ICELANDIC LANGUAGE With the Norwegian popular dialects and Faroese, Icelandic forms the West Norse subdivision of the Scandinavian languages, as opposed to the East Norse, made up of Swedish and Danish. The history of Icelandic begins with the settlement of Iceland by Norwegians, principally from western Norway, at the end of the ninth century. After this time there was gradually developed in Iceland a particular West Norwegian dialect, which, however, at the outset differed but slightly from the parent Norwegian. Only after the introduction of Christianity, about the year 1000, is it possible to speak of languages instead of dialects in the whole Scandinavian north, and at this time Icelandic, too, ranged itself by the side of Norwegian, Swedish, and Danish as a separate language, with characteristic differences in sounds, inflection, and vocabulary.

In the history of Icelandic it is customary to distinguish two main periods—Old Icelandic, from the settlement of the island, in the ninth century, to the Reformation, at the middle of the sixteenth century, and New Icelandic, down to the present day. Old Icelandic is further subdivided into three periods—the first of which extends from 874 until about to the middle of the twelfth century; the second, the so-called classical period, during which the principal literary works were produced, from about 1150 to about 1350, and the third, or transitional period, from 1350 to 1540. The language of the first period, at the beginning identical with that of Norway, at the end is distinguishable from it by but comparatively few differences. One of the most plainly discernible and characteristic distinctions between the two is the retention in Icelandic of initial *hl*, *hm*, *hn*, whose *h* early disappears in Norwegian, as it does in Swedish and Danish, but which has remained in Icelandic, alone of all the Germanic languages, to this very day. The language of the second period, on the

other hand, exhibits many important changes along broad lines, in phonetic conditions and in inflectional forms, that from this time on sharply differentiate Icelandic and Norwegian. This forms an intermediary period which witnesses the gradual growth of those changes in the language whose consummation marks the beginning of the new period of Icelandic. During this whole time the language remained practically homogeneous throughout the island, and no sharply defined dialectic differences were developed. Manuscripts of the thirteenth and fourteenth centuries from the west of Iceland show, it is true, characteristic phonetic conditions in certain instances, and it is likely that others existed as between the north, west, and southeast, but none of them are important. From 983 to about 1400 Icelandic was also spoken in the settlements of Greenland, but to what extent this language deviated from that of Iceland cannot be determined from the few runic inscriptions which have come down to us.

Old Icelandic, both from the standpoint of the language itself and of the literature written in it, is by far the most important of the ancient Scandinavian languages. The sources of our knowledge of it are an almost unparalleled literature in prose and verse, written after the early part of the twelfth century and even in the thirteenth century, but often of far more ancient ultimate origin. The alphabet used is the usual Latin script of the end of the Middle Ages, introduced by way of England and modified to fit the special conditions of the language. The few runic inscriptions that exist in Iceland are unimportant from a linguistic point of view, in that they are all more recent than the oldest manuscripts written in Latin letters. The oldest conditions, however, are in many cases not to be found in the oldest manuscripts, but in poems contained in manuscripts of the thirteenth century, which, as a consequence of their metrical construction, have kept forms as old in some instances as the ninth century, from which early time they had been transmitted orally from generation to generation. The oldest manuscript that has been preserved is an inventory of the church at Reykjavik in Iceland, the most ancient part of which was probably written between 1178 and 1193. The principal manuscript of the *Elder Edda*, the so-called *Codex Regius*, dates from the end of the thirteenth century, the principal manuscript of the *Snorra Edda*, the so-called *Codex Upsaliensis*, is of the same period. The best manuscripts are all written before the middle of the fourteenth century. Icelandic manuscripts are both parchment and paper. The former medium was used from the beginning of writing, at the end of the twelfth century, down into the sixteenth century, the latter from the fifteenth century almost to the present day. Old Icelandic manuscripts are preserved principally in four large collections—viz, the Arnæmagnæan collection, so called from the Icelandic Arni Magnússon, who collected and gave it to the University Library in Copenhagen, the collection in the Royal Library in Copenhagen, the so-called Delagardic collection in the University Library in Upsala, Sweden, and the collection in the Royal Library in Stockholm. Besides these there are a few manuscripts in the University Library in Christiania, Norway, in the British Museum in London, the Bodleian Library in Oxford, the Advocates' Library in Edinburgh, in Wolfenbüttel and Tübingen, Germany, in

Utrecht, Holland, in Vienna and Paris. No manuscripts of importance whatever have been left in Iceland, with the exception of the Reykjaholt inventory, which is a single quarto leaf of parchment preserved in the public archives in Reykjavik.

The most predominant characteristics of Old Icelandic as a Scandinavian language are, in the main, the following. To an extent unknown to the other members of the Germanic group Icelandic exhibits a consistent and widely developed process of assimilation in consonants and vowels, under this head falls the extraordinary extension of umlaut, which is here not merely a process of palatalization, as elsewhere in the Germanic languages, but of labialization as well. There are, besides this, a characteristic preference for suffixes, as exhibited in the use of the suffixed definite article with substantives, masc. *-nn*, fem. *-n*, neut. *-t*, the formation of an entirely new medio-passive conjugation by the suffixal use of the reflexive pronoun, and the expression of negation by an added *-gi*, *-a*, or *-at*. Other important characteristics are the universal shortening of the vowels of inflection and of derivation, the disappearance of final *n* in the so-called weak inflection of substantives and adjectives, and in the infinitive of verbs, whose accompanying preposition, furthermore, is *at*, instead of *du* (*zu*), as in the other Germanic languages, and the use of the consonantal case ending *-i*, elsewhere retained only in Gothic as *-s*, in masculine and feminine substantives. There are, in addition, many other minor peculiarities in sounds, inflections, and syntax. Contrasted with Old Swedish and Old Danish, whose earliest documentary remains date from 1281 and 1329 respectively, Old Icelandic possesses, as a whole, as is to be expected, a much more ancient character in sounds and in inflectional forms. It is, however, by no means invariably the most conservative. The far greater extension of the process of umlaut, e.g., in Old Icelandic, results in a large number of forms that are more recent than the corresponding ones in the other Scandinavian languages in their oldest period. The notably wide vocabulary of Old Icelandic shows some admixture of foreign elements. These are Latin words, introduced mainly through the Church after the Christianization of Iceland in the year 1000, Celtic words, introduced in considerable number as a result of the contact of Celtic-speaking people in the British Islands with the Norwegian settlers of Iceland, many of whom came by the way of Scotland, Ireland, the Orkneys, the Hebrides, and the Shetlands, where they had previously lived for longer or shorter periods, Anglo-Saxon words, which came in as a consequence of the close contact of Icelanders in England with the people, their language, and their culture, and finally, a few French and German words, due to the use in literature of foreign material, derived either directly or remotely from these sources.

The history of New Icelandic, or the present period of the language, begins with the Reformation, although the conditions that characterize it can already be observed in process of development in the transitional period at the end of Old Icelandic. The earliest literary monument of New Icelandic is the first Icelandic printed book, the New Testament, translated by Odd Gottskalksson, and printed at Roskilde in Denmark in 1540. In general, Icelandic has still retained, to the present time, along broad lines,

in inflections and vocabulary, its archaic characteristics, so that to-day it is on the whole the most ancient in appearance of the Germanic tongues. Since the beginning of the period the language has, however, in reality undergone a continual internal development. This is particularly true of the sounds, which have been very materially changed in pronunciation, although frequently the conservative retention of the old orthography gives no clew to it. What has helped Icelandic to retain its early conditions is, more than anything else, its relative isolation and the consequent minimum contact with other languages, on the one side, and the fact of its unbroken use in literature on the other. The production of literature in Iceland, although it dwindles in value and amount after the classical period until it is awakened to new life by the Reformation, has never wholly ceased since its very beginning. All this, with the continuous culture of the old literature, which has in some form or other never been forgotten, has tended to keep the language phenomenally pure and homogeneous throughout the island. After 1380, when Iceland, which since the end of the Republic in 1262 had belonged to Norway, fell with that country under the sovereignty of Denmark, a Danish influence was exerted upon the language which has continued, with varying effect, down to the present time. This influence was particularly active in the two centuries immediately following the Reformation, when, as a consequence of the reawakened literary activity, which brought with it many translations of foreign and especially of Danish books, it made itself felt in vocabulary and orthography to such an extent that the language seemed on the way to lose forever its characteristic purity. It was an appeal to the old literature which furnished the missing norm and not only checked the further introduction of Danicisms, but set on foot a reactionary tendency towards the forms and orthography of the classical period of the language. This puristic movement began towards the end of the eighteenth century, but was particularly furthered by the formation of the Icelandic Literary Society by the Danish philologist Rask in 1816. Since that time an influence has been carefully and intelligently exerted, both to eliminate foreign elements from the vocabulary, and either to rehabilitate old forms or to set in their place new forms made out of the old elements of the language, and to reform the orthography from the standpoint of etymology. A printed page of Icelandic at the present day has as a consequence a much more primitive character than the facts of its pronunciation actually warrant. In comparison with the other Germanic languages, changes have nevertheless been relatively few, and Icelandic, not only apparently but in reality, as it is in use to-day, is inherently the best preserved of this entire group.

The present territory of Icelandic, aside from small settlements in the United States and in British America, is the island of Iceland, where it is the spoken and written language of the 85,000 inhabitants. The literary language of the present time is to all intents and purposes the spoken speech, not of any particular region or of any separate class, but of the people of the whole country, with the reservation that in the capital and the trading places along the coast much Danish is in use, and the spoken language is no longer as pure as elsewhere. As

in the old period, there are no dialects in modern Icelandic, although there are still, as then, minor differences that give the language of certain parts of the country a local color.

Bibliography The standard grammar in German is Noreen's *Altislandische und altnordische Grammatik* (3d ed, Halle, 1903). A briefer treatment of Icelandic alone was published by the same author in 1913. Kahle's *Altislandisches Elementarbuch* (Heidelberg, 1913) and Holthausen's *Lehrbuch der altislandischen Sprache* (Weimar, 1895) are both excellent. The best treatment of the inflections in Danish is Wimmer's *Oldnordisk Formlære* (5th ed, Copenhagen, 1897). The earliest grammar in English is Dasent's translation of Rask's work (London, 1845). The most convenient grammar in English is Sweet's *An Icelandic Primer* (Oxford, 1886). Reference may also be made to Vigfusson and Powell's *An Icelandic Prose Reader* (ib., 1879). The whole subject of Old Northern grammar is treated scientifically by Noreen in Paul's *Grundriss der germanischen Philologie*, vol. 1 (Strassburg, 1901). A very careful treatment of modern Icelandic pronunciation will be found in Sweet's *A Handbook of Phonetics* (Oxford, 1877). The modern language is discussed in Carpenter's *Grundriss der neuslandischen Grammatik* (Halle, 1881). The best lexicons with English renderings are Vigfusson's *An Icelandic-English Dictionary, etc.* (Oxford, 1874), valuable for its references, but marred by careless etymologies, and Zoëga's *English-Icelandic Dictionary* (2 vols, Reykjavik, 1895-1904), as well as the same author's *Concise Dictionary of Old Icelandic* (Oxford, 1910). For the poetical language the standard work is still Sveinbjörn Egilsson's *Lexicon Poeticum Antiquæ Lingvæ Septentrionalis* (Copenhagen, 1854-60). The best recent dictionary is Fritzner's *Orðbog over det gamle norske Sprog* (3 vols, 2d ed, Christiania, 1883-96), with renderings in Danish. Larsson's *Orðforðdet i de alsta islandska handskrifterna* (Lund, 1891) contains an exact reference to each occurrence of every word in the oldest Icelandic manuscripts. Geirg's *Vollständiges Wörterbuch zu den Liedern der Edda* (Paderborn, 1903) and Möbius' *Altnordisches Glossar* (Leipzig, 1866) are valuable special dictionaries. Thorkelsson's *Supplément til islandske Ordbøger* (Reykjavik, 1876-85 and 1899) contains words not found in previous dictionaries, including Icelandic through the seventeenth century. Valuable special studies are Arpi, "Anmarkningar til nýislensk grammatik," in *Nordiska Studier*, pp. 70-77 (1904), and Fischer, *Die Lehnwörter des altwestnordischen* (Berlin, 1909).

ICELANDIC LITERATURE. In order to understand the remarkable brilliancy of the classical Icelandic literature of the twelfth and thirteenth centuries, it is necessary to bear in mind the fact that the early settlers were among the cream of the Norwegian people. In spite of the political difficulties that had induced these hardy Norsemen to seek a home almost in the ocean itself, intercourse between Iceland and the Scandinavian peninsula continued to be very close, especially as a result of the frequent visits made to Norway by young Icelanders of rank. Another reason for the literary supremacy of the early Icelanders is closely connected with one of the principal natural drawbacks of the island, its severe climate, and the consequent isolation of the people during the greater part of the year.

Persons in Iceland were thus greatly thrown upon their own resources. As a result, the art of story-telling was resorted to for passing away the monotony of the dark winter days. The periodical meetings in summer were used for an interchange of news and of stories and poems, and to this day the Icelanders are probably the greatest lovers of oral literature. The Icelandic classics still form the most popular reading matter of the masses of the people. This vitality of the Icelandic literature is again closely connected with social conditions. The Icelanders are a homogeneous people, and in reading the accounts of the early heroes of Iceland they read the stories of their own ancestors, whose names have been familiar to them from early childhood. For them the long genealogies, which the most patient foreign reader finds tiresome, are full of interest as family records of the remote past, and the most insignificant detail is fraught with the vividness of personal association.

Turning to the literature itself, we find, as is the case with the other literatures of the world, that the earliest monuments are in verse form. The earliest monument of Icelandic literature, furthermore, the so-called *Elder Edda*, is, like our own *Beowulf*, the most important and interesting work produced, and claims, more than any other single work, the attention of Icelandic scholars. The *Elder Edda* is not a poem, in the strict sense of the word, but a collection of more or less closely connected poems of varying length and character, which were preserved for a long time by oral tradition, suffering inevitable changes in the process of transmission. For many centuries the manuscript containing the poems was forgotten, and on its discovery in 1643 it was attributed to the classical writer Sæmund, called the Wise, who lived in the last half of the eleventh and the first half of the twelfth century. It has since been proved conclusively that it was redacted by an unknown Icander. A curious error is also frequently repeated with regard to the etymology of the word *Edda* itself, which is explained as meaning 'great-grandmother'. As a matter of fact, the name was improperly extended from a prose work, the so-called *Younger Edda*, the work of Snorri Sturluson (qv). The age of the *Elder Edda* has been greatly exaggerated, the oldest portions probably belonging in their present form to the tenth century. (For an account of the poems, see *EDDA*.) The *Younger*, or *Prose Edda* is of great value, because of the information it gives of Icelandic mythology and the language of the early skalds. It is a sort of *ars poetica* and was compiled for the guidance of young poets. Its style is admirable, its tales of the gods and goddesses being related with a due attention to effect. The style of most of the early Icelandic poetry is in marked contrast to the simplicity and directness of the classical prose. The most complicated figures and the most obscure references are freely used. The form is alliteration combined with assonance, or the agreement of medial vowels. Most of the poems of the skalds are short, eight verses each, but some few longer poems occur. The most striking of the latter are the three poems by Egil Skallagrímsson, the hero of the *Egils Saga*. They are much simpler than the short poems by the same author, and are full of feeling and dignity. Egil's elegy on his son may be ranked among the great poems of the world. To the eleventh and twelfth centuries belong poems com-

posed in imitation of the ancient works, consisting of moral and didactic maxims—the former conceived from an assumed heathen, the latter from a Christian, point of view. In the thirteenth century the skaldic art declined and gave place to an inferior literature based upon biblical stories and legends of the saints. Two centuries later appeared the *vísa*, or ballad, which closely resembles in form and subject matter the ballad as found on the Continent. These continued in popularity until the seventeenth century. Frequently the classical sagas were paraphrased in these *vísa*s.

The earliest Icelandic prose belongs to the beginning of the twelfth century, when Ari the Wise (1067–1148) composed a history of his native island and its population in the *Íslendinga-bók* (The Book of the Icelanders), which is a revision of an earlier work by Ari. The value of this work is historical rather than literary, for its facts, while detailed and reliable, are not presented in an interesting style. It has been edited, with a German introduction and notes (Halle, 1891). The *Landnámabók* (Landtaking Book), also by Ari, is based upon the earlier *Íslendinga-bók*. It describes the discovery and settlement of Iceland and contains detailed accounts of 3000 persons and 1700 places. It was continued by others. There is an English translation by T. Ellwood (London, 1898). These works entered largely into the composition of the annals of the early kings of Norway, composed a century later by Snorri Sturluson (qv), under the title of the *Heimskringla* (Circle of the World), the opening word of the work. This work deserves special notice as being the most important historical contribution of the Middle Ages. It is characterized by a vivid style, and so strongly does it appeal to the Icelandic consciousness that it is still the most popular book after the Bible in Iceland. A new translation into Dano-Norwegian has been made (1900) by G. Storm, and published with a subvention by the Norwegian Parliament. The best edition in the original is that edited by F. Jónsson (1893–1901), who has also edited a shorter edition (1911). A continuation of the *Heimskringla* was composed by several authors. It has twice been translated into English—by David Laing (London, 1844 and 1889) and by W. Morris and E. Magnusson (ib., 1895). Other histories belonging to a later period are *Flateyrbók*, containing a rather confused selection of sagas, the *Færeyingasaga*, which tells of the introduction of Christianity into the Faroe Islands (trans. by F. York Powell, 1896), and the *Orkneyingasaga*, relating the history of the earls of Orkney. The parts of the *Flateyrbók* relating to the discovery of America have been edited by A. M. Reeves in *The Finding of Vineland the Good* (London, 1890). The compilation of the laws of the island attracted the attention of the Icelanders at an early period, and in 1118 a complete code, known as the *Grágás* (gray goose), which had been derived from the ancient Norse law, was submitted to the Althing, or popular assembly, and in 1123 the canons of the Church, or the *Kristinnættir*, were settled and reduced to writing. A collection of these enactments in the ancient and subsequent codes has been made by Stephensen and Sigurdsson, under the title of *Lovsamling for Island* (21 vols., Copenhagen, 1853–89).

Of hardly inferior interest to the *Edda* and the *Heimskringla* are the sagas (qv). This

term in its broadest sense includes all Icelandic prose works of a narrative character. Thus, strictly speaking, Ari's works cited above are sagas, as is also the *Heimskringla*. But, as generally used, the term "saga" is applied to shorter narratives the interest of which centres in one person. The scene of the saga may be laid either wholly or in part in Iceland, or occasionally altogether outside of Iceland. Sagas are divided into several classes, the first of which is the mythic-heroic. The representatives of this class often give a later version of some well-known story which appears in other literatures. This is notably the case with the most interesting representative, the *Völsunga Saga*, earlier traces of which appear in the *Eddas*, and a later version in the *Nibelungenlied* (qv). It has been translated by W. Morris and E. Magnusson (London, 1888). The *Vilkina Saga*, treating of Dietrich of Bern, is later and shows German influence. The *Fridthofs Saga* is of special interest as being the earliest version of the story made famous by the Swedish poet Tegnér (qv). A number of legendary stories were translated into Icelandic prose, the most important of which is the *Saga of Balaam and Josaphat* (qv). The second and most characteristic class of sagas are the family sagas, accounts of individual men and their families. These biographies, as they would now be called, deal with the earliest settlers of the island and extend to about 1050. They are marked by great simplicity of style, with frequent highly dramatic passages, extreme detail, especially in connection with genealogies and chronologies, and keen characterization. A striking feature of all the sagas is the introduction of verses supposed to be the work of the characters. This is particularly noticeable in the *Kormaks Saga*, which contains an average of over one poem to each page. The family sagas are subdivided into two classes, the larger sagas and the smaller sagas. To the first belong the *Njáls*, the *Egils*, the *Laxdæla*, and the *Eyrbyggja*. Of these, the first has been admirably translated by G. Webbe Dasent (New York, 1912), and the last was translated in a condensed form by Sir Walter Scott. The *Egils Saga* has been edited with a German introduction and notes by Finnur Jónsson (Halle, 1894), and in the same series the *Laxdæla Saga* has appeared, edited by Kr. Kaalund (1896). Among the smaller sagas the most interesting are the *Kormaks Saga* and the *Saga of Gunnlaug Serpent Tongue*, both of which are love tales. Apart from their literary qualities, the Icelandic sagas are of great value in throwing light upon many Old Norse customs—religious, legal, and social—that would otherwise be entirely unknown. This is especially true of the *Eyrbyggja*. For the English reader, the introduction to Dasent's translation of the *Egils Saga* is of interest in connection with the general subject of sagas.

Modern Icelandic literature begins with the introduction of printing (1530) by the last Roman Catholic Bishop of Iceland. The first Icelandic translation of the New Testament was made in 1540. During the seventeenth century many learned works were written, the leader in this movement being A. Grímur Jónsson (1568–1648). Many manuscripts were collected and copied, and communication between Icelandic and Danish and Swedish scholars was close. Grammars and dictionaries were compiled, and many antiquarian works were published. Among the principal scholars of this period were Thor-

mod Torfæus (1636-1719) and Arní Magnússon (qv). During this same period, and without interruption down to the present day, Iceland has produced a surprisingly large number of poets—a larger number, indeed, in proportion to the population, than any other country in Europe. Among these poets may be mentioned Hallgrímur Pjetursson (1614-74), the leading Icelandic psalm writer, Stefán Olafsson (1620-88), Eggert Olafsson (1726-68), and Jón Thorláksson (1744-1819). The latter made an excellent translation of *Paradise Lost* and Klopstock's *Messias*. Among nineteenth-century poets may be noted Bjárni Thórarensen (1786-1841), who is probably the most popular recent Icelandic poet, Jónas Hallgrímsson (1807-45), who introduced several foreign verse forms, notably the hexameter. Of the younger poets we may mention Gestur Pálsson (1852-91), Steingímur Thorsteinsson (1831-), Thorsteinn Erlingsson (1858-), and Hannes Hafsteinn (1861-). The most prominent dramatists are Matthías Jochumsson (1835-), also one of the most productive poets and translators, Indriði Einarsson (1851-), who began as a Romanticist, but in his later works shows strong Ibsenian influence, and Jóhann Sigurjónsson, whose *Fjalla-Eyvindur* (Eyvind of the Mountains) is the strongest Icelandic drama to date. The principal Icelandic novels are Jón Thoroddsen's *Pítur ok Stúlka*, translated by Reeves as *Lad and Lass* (London, 1890), and *Maður ok Kona* (Man and Wife).

Bibliography. The standard history of Old Norse literature is Finnur Jónsson's *Den oldnorske og oldislandske Litteraturs Historie* (3 vols, Copenhagen, 1894-1902). *Den islandske Litteraturs Historie* (ib, 1907) is a shorter work by the same author. The only treatment of the whole subject in English is Winkel Horn, *History of the Literature of the Scandinavian North*, translated by Anderson (Chicago, 1884). This contains a useful bibliography. The *Prolegomena* to Vigfússon's edition of the *Sturlunga Saga* (Oxford, 1878) discusses the classical literature, and the same author's *Corpus Poeticum Boreale* (ib, 1883) contains a complete collection of the poetry down to the thirteenth century, with English translations, notes, etc. Vigfússon and Powell, *Origines Islandicæ* (Oxford, 1905), contains sagas and other texts, usually accompanied by English translations. Consult also Morris and Magnússon, *Saga Library* (6 vols, London, 1891-1905), Mogk, *Geschichte der norwegisch-islandschen Literatur* (Strassburg, 1904), W. C. Green, *Translations from the Icelandic* (London, 1908), Hensler, *Zum islandischen Fehdewesen in der Sturlungazeit* (Berlin, 1912); Craigie, *The Icelandic Sagas* (New York, 1913). See also SAGA.

ICELAND MOSS (*Cetraria islandica*) A lichen found in cold climates, especially in Iceland and Norway, in which places it forms an important article of commerce. It is also met with on the higher mountains to the south, but is not collected in quantity. It is used largely as a food by the Icelanders and the Laplanders, who either powder the dried plant and make it into bread or boil it with milk. As food also it has been used in other countries to which it is exported. Before it becomes edible, however, it must be steeped in water to remove a bitter principle. Other uses are in the manufacture of sizing paper and in dressing the warp in weaving. Formerly it was used as a remedy

in pulmonary troubles, but is now regarded as a bland mucilaginous diet in such cases.

ICELAND SPAR. A transparent variety of calcite that is found chiefly in Iceland. Owing to its transparency and double refracting property, it is used for polarizing prisms and in other optical instruments. See CALCITE.

ICE MAKING. See REFRIGERATION, ICE INDUSTRY.

ICE NEEDLES. See FROST.

ICE'NI. A tribe of ancient Britain, occupying, as is supposed, the present counties of Norfolk and Suffolk. The Icení joined the ranks of Aulus Plautius in 43 A.D. and aided in the defeat of the sons of Cymbeline (qv). Some years later, when the Romans endeavored to establish their authority more firmly in the country, the Icení rebelled under their Queen, Boadicea (qv), but were subdued. Consult C. W. C. Oman (ed.), "England before the Norman Conquest," in his *History of England*, vol. 1 (New York, 1910).

ICE PACK. See ICE.

ICE PLANT (*Mesembryanthemum crystallinum*). A native of Africa and of the south of Europe, remarkable for the glistening bladder-shaped hairs with which its whole surface is covered, and which sparkle in the sun like granules of ice. The seeds are used for food in the Madeira Islands. The ashes supply barilla, which is extensively used as a source of carbonate of soda in soap and glass making, and for which the plant is burned in countries where it abounds. There are in all about 400 species of this genus, most of which are natives

ICE PLANT

of the south of Africa. The ice plant is introduced and spreading in southern California. *Mesembryanthemum æquilaterale*, a trailing plant, is also common in California, where its purple flowers, 1½ inches across, are very striking. *Mesembryanthemum edule* bears edible fruits called Hottentot figs.

ICE POLO. A game on skates, which should not be confounded with ice hockey nor with the equestrian game of polo, though it is related to both these games. While ice polo is similar in object to ice hockey, it is very different in

methods of play. A ball is used instead of a puck, the construction of the stick and the method of handling it are different, and there is a more open manner of play. This open play is brought about through the permission to indulge, in an ice-polo game, in what would in ice hockey be off-side play, i.e., getting between the ball and the opponents' goal. Five men make up a team, two less than in ice hockey. There are two rushers, one centre, one halfback, and one goal tend. The goals are 4 feet wide, and the distance from goal to goal is 150 feet. There are two playing periods of 20 minutes each, with 10 minutes' interval. A goal counts three points. See HOCKEY.

ICE YACHTING Excepting Russia, no country in the world shares with America the sport of ice yachting, and Russia is only a sharer in the sense that a few of its boats, such as those of the Russian River Club, are sailed over a portion of the Gulf of Finland, near St. Petersburg. As early as the year 1790 there were ice boats, and contests at Poughkeepsie on the Hudson, the runners of one of the boats being still preserved. It was built by Oliver Booth and was little more than a square box on three runner skates—one on each side of the box, and the rudder one set in an oak post with an oar tiller. It was sailed with a small flat-headed spritsail. More than half a century passed before there was much improvement in this primitive design. The first real innovation was that of Allaire of Red Bank, N. J., on the Shrewsbury River, who in 1856 mounted his three runners on a triangular frame—a pattern that was at once seen to give advantage over the previous method. From this the Hudson River boats were gradually developed, the side bars forming with the body a bridge or runner plank (at right angles with the body of the yacht) projecting on each side and carrying at each end one runner or skate. The mast was stepped at the junction of the runner plank with the main beam, and they had low sails with large jibs, short nonpeaked gaffs, and booms extending many feet out from the stern. This style reached its limit in 1869 in the old *Iceole*. The stepping of the mast over the runner plank placed the centre of effort so far aft that the boats would run away with their occupants and throw them out, sometimes to their great peril. In 1879 this class was practically superseded, on the Hudson River, by the *Robert Scott* type of a single backbone with an elliptical steering box. Then the mast was stepped forward of the intersecting runner plank, and the jibs and boom shortened. Improvements have continued, but mainly in construction, which has aimed at strength combined with lightness in backbone and masts, and springiness in the cross or runner plank—a very desirable condition, for if a runner under an ice yacht weighing 2000 pounds and going at 45 miles an hour strikes a hummock of ice and has no give or spring in it, the consequence may be a shock that will reduce the craft to pieces. In the year 1866 the lateen sail was adopted, both on the Hudson and Shrewsbury rivers. *Scud*, with the largest lateen ever rigged, was sent from the Shrewsbury to Poughkeepsie on the Hudson and entered for the pennant several years. She, as well as *Arrel* and *Blizzard*, was exceedingly fast, but without apparent reason they would spin round on their heels like tops, or bolt, and in spite of its many admittedly good qualities

and undoubted speed, the rig lost supporters. Theoretically any sailing craft should do its best with all its canvas in one piece. *Flying Scud* modified the lateen by spreading its 615 feet of sail, or catboat fashion, by supplementing it with a small jib, and *Vixen* and *Range* had other developments of the lateen. The lateen sail has still some staunch friends. The *George* of the Shrewsbury River fleet, and Colonel Higginson's *Cold Wave*, with the Mobergan cat rig, are two examples of it.

The latest design in runners is that of H. Percy Ashley, known as the rocker type. These have a curve fore and aft. They are especially useful on rough ice. The elongated tiller, too, is of the utmost importance on occasions, because it allows the sailor to lie head forward in the steering box and guide the yacht with his feet while yet tending sheet with his hands.

The usual course in races is a triangle of one mile on each leg, of which only one can be before the wind, and five times around the triangle constitutes a heat. This necessitates 14 sharp turns. The time made by boats over such a course necessarily varies very much on each leg, and still more from day to day, according to the condition of the ice and the force and direction of the wind. The world's record for speed over a two-point course was made in 1907 at Kalamazoo, Mich., by the *Wolverine*, of the Kalamazoo Ice Yacht Club, which sailed a 20-mile course in 39 minutes 50 seconds, the boat being obliged to turn every two miles. The exact distance sailed is unknown. The fastest time made in the pennant championship was in 1893 by *Jack Frost*, which sailed a 20-mile course in 49 minutes, 30 seconds, or at the rate of a mile in 2 minutes, 28 seconds, but the calculated distance the yacht sailed was 31.38 miles, and her rate was therefore a mile in 1 minute, 34 seconds. Much faster time has been made on a straight-away course in a favorable wind. In Stone's *Ice-Boating*, Archibald Rogers reports his test of several small boats over a measured mile. He says "the best record was 59 seconds. Estimated speeds, that is, sailing up or down the river between known landmarks, have given still higher rates of velocity, in one instance a passage was made by two yachts racing on a reach where the time made was believed to be at the rate of 84 miles per hour."

The principal original locations for ice yachting are the Hudson River above Poughkeepsie, Newburgh, and Orange Lake, N. Y., the Shrewsbury River in New Jersey. From these the sport spread westward in the sixties to Lake Minnetonka, Minn., where it was introduced by Theodore Wetmore, and much fine sport has been had by yachtsmen from St. Paul and Minneapolis. Lake Winnebago, Wis., has also a half-dozen clubs on its borders. Lake Pepin, about 40 miles south of St. Paul, is the centre for the boats of several towns, and there is much racing on Gull Lake at Kalamazoo, Mich., and along the American shores of Lake Erie and Lake Ontario. There is excellent sport at Burlington, Vt., on Lake Champlain.

There are many prizes annually competed for; but as ice yachts are by their nature difficult to move from watershed to watershed, they are mostly local. For a series of informing articles on the history and development of the ice yacht, with precise directions for the construction of various types of the craft, consult Stone, *Ice-*

Boating (New York, 1913), and H P Ashley, *How to Build an Ice Yacht* (ib, 1914)

ICHABOD, ik'a-bōd A poem by Whittier, intended as a rebuke to Daniel Webster for his change of attitude towards the question of slavery

ICHANG, ē'chang', or **ECHANG** A *fu*, or departmental city, of the Province of Hupeh, China, situated on the left bank of the river Yang-tse, about 1000 miles from the sea, and about 10 miles below the entrance to the great Yang-tse Gorges (Map China, K 5) It stands in the centre of a hilly country rich in rice, cotton, wheat, barley, and wood-oil trees (the *Tung-shu*, or *Aleutites cordata*), and many kinds of fruit grown in the sheltered valleys near by The climate is dry, with warm summers and pleasant winters

The place is of great commercial importance, as the river may be navigated with comparative ease up to this point by vessels of light draft The few attempts that have been made to mount the rapids of the upper Yang-tse have resulted in disaster Hence all cargoes destined upstream are here transhipped to craft specially constructed for the navigation of the river above Ichang, and most of the downstream cargoes from Szechwan are also transhipped The city is one of four opened in 1877 to foreign residence and trade, in accordance with the convention signed at Chefoo in 1876, and a few foreign business houses have agents here Great godowns or warehouses have been built to accommodate this transit trade, and a foreign settlement has been laid out just below the native city In 1912 the total imports of Ichang amounted to hk tls 2,065,825 (in 1912 a tael was worth \$0.70 United States gold), and total exports to hk tls 3,487,070, making the total trade of the port in that year hk tls 5,552,895 Of the imports, hk tls 1,150,530 came from foreign countries, and hk tls 915,275 from Chinese points An immense amount of produce from the Province of Szechwan is reshipped at Ichang for ports downstream and upstream

Steamer traffic is mainly in the hands of the British and Chinese Some 19,000 native craft of all sizes (the largest probably about 60 tons) pass this port or call at it in the course of the year, the river being practically the only way of reaching the rich coal fields and fine agricultural lands of Szechwan, and the northern parts of Kweichow and Yunnan Ichang has a splendid location as an emporium for the exchange of goods and products, but Hankow and Shanghai far excel it in that respect The population numbers about 55,000 A route for a railway from Ichang to Hankow was surveyed in 1905 By December, 1914, a distance of 80 miles from Ichang had been constructed A railway from Ichang to Hankow is now contemplated

ICH DIEN, ik dēn (Ger, I serve). The motto of the Prince of Wales, which, surmounted by three ostrich feathers (originally one), forms his official crest According to one theory of its derivation Edward I, on presenting his new born son, Edward of Carnarvon, to the Welsh, who had demanded a native-born prince, used the expression in its Welsh signification—*Eich dyn* (Behold your man) Another view, not historically verified, attributes it to the occasion of the killing of John, King of Bohemia, by the English at Crécy, and asserts that the Black Prince found the motto under the plume worn by the dead King and assumed it

to imply that "he served under the King, his father"

ICHIJI, ē'chē'jē', H (1860-1912). A Japanese naval officer He entered the Japanese naval college in 1874, was naval attaché in Rome during the Chino-Japanese War, and became captain in 1900 In 1903 he was appointed captain of the *Nikasa*, he served as flag captain under Admiral Togo during the Russo-Japanese War, and became rear admiral in 1906 and vice admiral in 1910 He twice commanded the Japanese training squadron which visited Australia and the United States between 1906 and 1909 At the time of his death he commanded the naval station at the Pescadores and was a member of the Admiralty Board

ICHNEUMON, ik-nū'mōn (Lat, from Gk *ἰχνεύμων*, *ichneumōn*, tracker, from *ἰχρεῖν*, *ichneuein*, to track, from *ἰχνος*, *ichnos*, track) An old name for the civet of the genus *Herpestes*, now generally called mongooses (See Mongoose) The name belongs specifically to the Egyptian mongoose, or "Pharaoh's cat" (*Herpestes ichneumon*)

ICHNEUMON FLY An insect of a group of parasitic Hymenoptera, forming the family Ichneumonidae More than 2000 genera and 25,000 species of ichneumon flies have been described Economically considered, they are among the most important groups of insects, since without exception they are parasitic upon or within other insects, and in the very great majority of instances they destroy injurious species As a rule, the ichneumon fly lays her eggs beneath the skin of the host insect The egg hatches, and the young footless grub feeds upon the fat and blood and lymph of the host, piercing the fatty tissue with a pair of sharp-pointed jaws It respects the viscera and vital organs

A LARGE ICHNEUMON FLY

Male (b) and female (a) of *Thalessa lunator*, in relative size, the latter in the act of forcing her ovipositor into a log

of the host up to the last limit and only sacrifices them towards the completion of its growth Its skin is very delicate, and it breathes by absorbing oxygen through this skin from the blood of the host insect and not, as the older writers supposed, by placing itself in communication with the tracheae of the host The digestive tube has a very large stomach, which is closed behind and remains closed until the larva is full grown When this time is reached, and the larva transforms to pupa, a rectal opening is formed, and the excrement is voided That such an economy as this is necessary to the life of the parasitic larva is at once seen when we consider that if the excrement were voided daily it would cause speedy inflammation and the death of the host insect before the parasite could

become mature It was formerly supposed that for this same reason the parasitic larva did not cast its skin, but Seurat has recently shown that some of them do occasionally molt

Some ichneumon flies lay their eggs on the skin of the insects they attack, and others near the host insect, so that the parasitic larva, after hatching, finds its way to its prey When the host insect is an internal feeder, like a wood borer or a gall insect, the ichneumon larva lives upon instead of within the host There is no uniformity in the degree of rapidity with which they develop, and they may pass the winter months either as larvæ, pupæ, or adults As a rule, they are long-bodied, slender insects, varying much in size Many of them have long, stinglike ovipositors—in some instances, as in *Rhyssa*, more than twice as long as the body

Both the scientific and popular names of this group of insects were derived from the Egyptian ichneumon, or "Pharaoh's iat," which devours the eggs and young of the crocodile

Consult Comstock, *Manual for the Study of Insects* (Ithaca, 1885), Sharp, *Cambridge Natural History*, vol v (London, 1895), Ashmead, "Classification of the Ichneumon-Flies," in *Proceedings of the United States National Museum* (Washington, 1900), Viereck, "Type Species of the Genera of Ichneumon Flies," in *United States National Museum, Bulletin* 83 (ib, 1914) See COLORED PLATE OF INSECTS

ICHTHOLOGY, ik-nól'ô-jî (from Gk *ἰχθυος*, *ichnos*, trace + *-λογία*, *-logia*, account, from *λέγειν*, *legen*, to say) The study of fossil footprints, tracks, trails, and impressions found in the rocks of various geological ages The most prolific sources of such footprints and impressions in North America are the Jura-Trias sandstones of Massachusetts, Connecticut, and New Jersey Prof Edward Hitchcock gathered a great collection of them from the New England localities and placed it in the Amherst College Museum This collection contains over 8000 tracks, and it furnished the material for Hitchcock's *Ichthyology of New England A Report on the Sandstone of the Connecticut Valley, especially its Fossil Footmarks* Many of the tracks therein described were first supposed to have been made by birds, but they are now known to be the footprints of ornithomimid dinosaurs like *Anchisaurus* (q v) Still others were made by heavy five-toed animals of unknown nature Some of the smaller tracks were made by insect larvæ which are found in the same series of deposits (See MORMOLUCOIDES) For an entertaining account of fossil footprints, see the chapter on "Impressions of the Past," in F A Lucas, *Animals of the Past*, "American Museum of Natural History, Handbook Series, No 4" (New York, 1913), also consult Lull, "Nature's Hieroglyphics," in *Popular Science Monthly* (ib, 1904) See FOSSIL, JURASSIC SYSTEM, TRIASSIC SYSTEM

ICHTHYOCRINUS, ik'thî-ôk'ri-nûs (Neo-Lat, from Gk *ἰχθύς*, *ichthys*, fish + *κρίνον*, *kérnon*, lily) The representative genus of the important family Ichthyocrinidae of the Crinoidea In this family the base is dicyche, the radials are succeeded by costals which increase in size upward, the brachials are united by more or less wavy sutures, and the arms are nonpinnate In *Ichthyocrinus* the radials and lower brachials are laterally in contact, as all sides and the crown appear like a perfectly solid body when the short arms are closed. The genus extends

from the Silurian to the coal measures and is found both in Europe and America, but is best known by its representatives in the Niagara group See CRINOIDEA

ICHTHYODORULITES (pl, from Neo-Lat from Gk *ἰχθύς*, *ichthys*, fish + *δόρυ*, *dory*, spear + *λίθος*, *lithos*, stone) The fossil spines of sharks, which are often found isolated in the ancient rocks Many of them are of large size and because of their hardness and phosphatic nature have been preserved with a considerable degree of perfection Some of them are well known under the names *Ctenacanthus*, *Mæcaracanthus*, *Plemacanthus*, *Cyracanthus*, etc Some of these spines have been found in their original positions at the front edges of the fins of fossil sharks See SHARK

ICHTHYOL, ik'thî-ôl (from Gk *ἰχθύς*, *ichthys*, fish), or AMMONIUM ICHTHYOL-SULPHONATE A dark-red oily liquid obtained from a bituminous quartz rich in fossil fish, found in the Tirol and on the coasts of the Adriatic Sea To prepare the drug, the mineral is distilled with strong sulphuric acid, a saturated aqueous solution of common salt is added to the distillate, and the ichthyol-sulphonic acid which separates out is neutralized with ammonia The ichthyol thus obtained has a disagreeable bituminous odor and taste and is soluble in water, in glycerin, and in various oils It is an antiseptic, mild irritant, and somewhat of a styptic It is absorbed with ease by the skin when applied externally and by the intestinal mucous membrane when administered internally It is one of the best-known remedies for eczema, in which disease it is applied externally in the form of an ointment made up with lanolin The same preparation is highly recommended for cases of acute articular rheumatism, as affording prompt relief by reducing the pain and the swelling Unna has declared it to be the remedy par excellence in acne He applies it externally in the form of a 15 per cent ointment and gives it internally in doses of from 2 to 10 grains in pills or in capsules, he also recommends the free use of ichthyol soap Ichthyol is extensively employed in the treatment of various skin diseases and is said to be particularly efficacious in eczema, chronic urticaria, and simple syphilis It is frequently prescribed, with success, as a local application in chronic nasal catarrh, especially in the form known as ulcerative rhinitis The formula of ammonium ichthyol-sulphonate is supposed to be $C_{25}H_{26}S(SO_3NH_4)_2$ But the ichthyol ordinarily sold contains also a strongly smelling oil, some ammonium sulphate, and a great deal of water Ichthyol can be freed from its disagreeable odor without in the least impairing its therapeutic power, and at present such an ichthyol preparation is to be found in the pharmaceutical market

ICHTHYOLOGY, ik'thî-ôl'ô-jî (Gk *ἰχθύς*, *ichthys*, fish + *-λογία*, *-logia*, account, from *λέγειν*, *legen*, to say) That branch of natural history which treats of fishes See FISH

ICHTHYOPHAGI, ik'thî-ôf'a-jî (Lat nom pl, from Gk *ἰχθυοφάγοι*, *Ichthyophagoi*, fish eaters, from *ἰχθύς*, *ichthys*, fish + *φαγεῖν*, *phagein*, to eat) Among the ancient Greeks, a name for various tribes of coast dwellers on the southern seas, eg, in Asia, on the coast of southern China, Gedrosia, and northeastern Arabia; in Africa, on the west coast of the Arabian Gulf and in Senegambia

ICHTHYOPSIDA, ik'thî-ôp'si-da (Neo-Lat,

from Gk *ἰχθύς*, *ichthys*, fish + *ὄψις*, *opsis*, appearance) A division of the Vertebrata, including all such forms as have no amnion and allantois, but which have, either persistently or temporarily, gills as their respiratory organs. The group includes the Amphibia (qv) and the fishlike forms. This division was introduced by Huxley.

ICHTHYORNIS, *ik'thi-ōr'nis* (Neo-Lat., from *ἰχθύς*, *ichthys*, fish + *ὄψις*, *opsis*, bird). A genus of toothed birds of the Cretaceous age, found fossil numerously in western Kansas, along with remains of *Hesperornis*, *Aptornis*, and the like. These two genera represent the division Odontotormæ of the toothed birds (see BIRD, FOSSIL), characterized by having the teeth, with which the mandibles were plentifully furnished, set each in a separate alveolar socket. The various species were birds not greater than a pigeon in size and resembling terns in general appearance and probably in habits. They were sea birds of powerful flight, and the structure of their wings, legs, and carinate sternum much

triangular fin at the middle of the back. The body was covered with thin, smooth skin, and no traces of dermal plates have been discovered. The jaws were armed with a large number of sharp, conical teeth that have a complicated internal structure similar to that of the teeth of Labyrinthodonts or Stegocephala. The eyes are surrounded by circles of sclerotic bones, and there is a large pineal foramen on top of the skull between the eyes. The vertebrae are biconcave, and the pelvic arch is separated from the vertebral column, for there is no sacrum. In size they ranged from 4 to 40 feet, and they must have swarmed in immense numbers in some portions of the European seas, especially during Liassic time, for their remains have been found in abundance in deposits of that age at Lyme Regis, England, and in Wurttemberg, Germany. That they were predacious animals and fed largely on fish, is evidenced by the fish fragments found within their coprolites and also within the abdominal cavity of some skeletons. Some ichthyosaurs were viviparous, for specimens obtained in the Wurttemberg quarries show several small embryonic skeletons contained in the abdominal cavities of the adults. About 35 species of *Ichthyosaurus* are known, and they have been found in the Mesozoic deposits of Europe, the East Indies, Australia, New Zealand, and South America. Allied genera are *Mosasaurus*, of small size from the Trias, and *Ophthalmosaurus*, a toothless ichthyosaur from the Upper Jurassic and Lower Cretaceous. A single representative, *Baptanodon*, is found in the North American Jurassic and is very close to *Ophthalmosaurus*. The ichthyosaurs and their allies, together with the Sauropterygia, comprising the plesiosaurs and allied forms, were formerly included in an order Enaliosauria, which is not now recognized.

Bibliography. Owen, *Monograph of the Fossil Reptiles of the Liassic Formation Part III, Ichthyopterygia* (London, 1881), Nicholson and Lydekker, *Manual of Paleontology*, vol. 11 (Edinburgh, 1889), Fraas, *Die Ichthyosaurier der sudeutschen Trias und Jura Ablagerungen* (Tubingen, 1891), Woodward, *Outlines of Vertebrate Paleontology for Students of Zoology* (Cambridge, 1898), Merriam, "Triassic Ichthyosauria," in *University of California, Memoirs*, vol. 1 (Berkeley, 1908), Knipe, *Evolution in the Past* (London, 1912). See REPTILE.

ICHTHYOSIS, *ik'thi-ō'sis* (Neo-Lat., from Gk. *ἰχθυόσις*, from *ἰχθύς*, *ichthys*, fish), or FISH-SKIN DISEASE. A disease characterized by a hardened, thickened, rough, and almost horny state of the epidermis, which breaks into small, irregular, scalelike pieces, which do not readily exfoliate, but which if removed are speedily reproduced. In the localities less profoundly altered by the ichthyotic condition, there is hypersecretion of sweat, in the hardened and thickened places many sudoriparous glands are suppressed, and the surface is dry. The disease may affect almost the whole surface or may be confined to a single part, and is most frequently, but not always, congenital. It is attended with

SKULL OF ICHTHYORNIS

a, cranium and upper mandible of *Ichthyornis regalis*, b, lower mandible of the larger *Ichthyornis victor*

resembles that of modern birds. The skull, however, retains many reptilian features besides the teeth, such as the diminutive elongated space for the brain, the single-headed quadrate bone, and the union of the lower jaws in front by a ligament. The vertebrae, also, differ from those of *Hesperornis* and all modern birds in being biconcave. This form of vertebra is seen in a few recent and many extinct reptiles, but is especially characteristic of fishes, the presence of this character alone would indicate the very antique origin of the group. These birds doubtless lived and fed as do modern gulls, seizing living fishes, and going ashore only to breed and roost at night. They were doubtless well feathered and seem to have flourished until the end of the Cretaceous era. Most of the fossil remains thus far obtained are in the museums of Yale University and of the University of Kansas. See HESPERORNIS, and consult the authorities there referred to.

ICHTHYOSAURUS, *ik'thi-ō-sa'rūs* (Neo-Lat., from Gk. *ἰχθύς*, *ichthys*, fish + *σαῦρος*, *sauros*, lizard). An extinct genus of fishlike reptiles found in the Mesozoic rocks of Europe and North America. The ichthyosaurs among reptiles are analogous to the whales among mammals, and they have many points of resemblance to these. Their bodies were round and tapering, heads large, with long snouts and very short necks, limbs reduced to paddles, and they had a broad, vertical fin on the tail and a

no constitutional disturbance. The disease is extremely obstinate and when congenital may be considered as incurable. The treatment consists in the frequent use of the warm or vapor bath, so as to soften the thickened epidermis and to facilitate its removal, and friction by means of a piece of flannel may be conjoined with the bath. The internal administration of tar, cod-liver oil, etc., sometimes gives relief.

ICHTHYS, ik'this (Gk *ἰχθύς*, *ichthys*, fish). An early Christian symbol. It was discovered that the Greek word for fish consisted of the first letters of the common ascriptive title to Christ: Jesus Christ, the Son of God, the Saviour, or in Greek Ἰησοῦς Χριστὸς Θεοῦ Υἱὸς Σωτήρ. A fish thus became the symbol of Christ, and to make the sign of a fish was to give to the initiated the plainest indication of being a Christian. Accordingly it entered into the freemasonry of early Christianity. Both the acrostic and the figure of a fish appear upon the monuments.

ICICA, is'i-ka. See **PROTIUM**.

ICILTIUS. The name of a plebeian family in Rome, which produced some of the most zealous defenders of the plebeians against the patricians. The name of one of them, betrothed to the unfortunate Virginia, is associated with one of the most touching incidents in the legendary history of Rome. See **APPIUS CLAUDIUS CRASSUS**.

ICILIUS, QUINTUS. See **GUICHARD, K. T.**
ICKELSAMER, ik'el-sa'mēr, VALENTIN (c 1500-c 1537). A German grammarian. Nothing definite is known of his life. He was perhaps born at Rothenburg-an-der-Tauber, at any rate, about 1525 he was schoolmaster there. From the title-page of one of his works we may gather that he lived for a time, possibly as schoolmaster, at Kailstadt. Afterward he lived at Erfurt and at Augsburg. His two principal works were *Rechte Weis auff's künztlich lesen zu lernen* (c 1527), the foundation of the German phonetic method, and *Teutsche Grammatica* (written c 1527, but published with neither date nor place), one of the earliest German grammars. Both these books are reprinted in Müller, *Quellenschriften und Geschichte des deutschsprachlichen Unterrichts* (Gotha, 1882). Consult Vogel, *Leben und Verdienste V. Ickelsamers* (1894).

ICKNIELD (ik'nēld) **STREET, or WAY**. An ancient road running from Cornwall to Norfolk in England. The name is connected with the Iceni. See **FOSSWAY**.

ICOLMKILL, ik'om-kil'. See **IONA**.

ICON BASILIKE, i'kōn ba-sil'i-kē. See **BYZANTINE BASILICA**.

ICONIUM. A town of Asia Minor. See **KONIEH**.

ICONOCLASM (from Gk *εἰκών*, *eikōn*, image + *κλάν*, *klan*, to break). The name given to any movement against the religious use of images, but especially to the crusade against their use which excited the whole Eastern church in the eighth century, dating in its definite character from a decree of the Emperor Leo, the Isaurian, which enjoined the destruction of such images. The question was settled by ecclesiastical authority at the second Council of Nicaea (787) (qv), when the cult of images was sustained as veneration, not adoration. In 811, under a new line of iconoclastic emperors headed by Leo V, the controversy raged anew till 842, when images were restored by Imperial com-

mand. There was also some iconoclastic trouble after the second Council of Nicaea in the Frankish church. During the Reformation the Protestant revolt against images in the churches caused iconoclasm both on the Continent and in England. Consult Schwartzlose, *Der Bilderstreit* (Gotha, 1890), and Harnack, *History of Dogma*, vols. III, IV, V (Boston, 1897-99). See **IMAGE WORSHIP**.

ICONOCLAST. The nom de plume of Charles Bradlaugh.

ICONOCLAST EMPERORS. The Byzantine emperors by whom the contest against iconolatry in the Eastern church was waged. Leo III the Isaurian, Constantine V, Leo IV, Leo V the Armenian, and Theophilus.

ICONOGRAPHY. A term originally used, in its etymological sense, to signify the science of antique portraiture, i.e., the discussion, enumeration, and history of the portraits of prominent persons in statues, busts, paintings, coins, gems, etc. This science was first resurrected by Michelangelo and Fulvius Ursinus, and further developed by Canini, in his *Iconografia* (Rome, 1669), and especially by Visconti in a series of monumental works cited below. The term "iconography" is occasionally applied to the portraits or images of mythological personages and objects of antiquity—a subject generally treated in the article **MYTHOLOGY IN ART**. Its chief use, however, is in reference to the attributes, emblems, and symbols with which Christian deities, saints, and conceptions are represented in art.

Christian Iconography. In the early Christian centuries the representations were few in number and quite simple, leaving much freedom to the artist. They embraced subjects like the "Good Shepherd" and the emblems of faith, familiar to all. In the fourth and fifth centuries iconography became more complicated. The clergy began to use it as a factor of systematic religious instruction, controlling the representations which were now executed in strict accordance with formulas. Christ, as King of Heaven, was by far the favorite subject from the fourth to the seventh century, while from the eighth to the twelfth the "Last Judgment" and scenes from the Revelation were in vogue. There were two schools—the Eastern, or Byzantine, and the Western, or Latino-German. The former was by far the most original and important, dominating not only the East, but Europe during the Carolingian period, and remaining supreme in Italy until late in the Gothic age. It found its expression in mosaics, frescoes, and illuminated manuscripts, sculpture being excluded as a result of the iconoclastic conflict. (See **BYZANTINE ART**.) The iconography of the Romanesque (qv) period was meagre and unsystematic, but during the Gothic age an independent Western system originated in France, spreading throughout Europe. In the North it found its chief expression in the sculptures of the great cathedrals and endeavored to represent the encyclopædic conceptions of the scholastics. (See **GOTHIC ART**.) In Italy it manifested itself chiefly in painting. Iconography remained under clerical control until, with the Renaissance, the human element superseded the divine, the old subjects being used as a means for the expression of human feeling and artistic ability. The old subjects from biblical history, especially those illustrating the plans of salvation and those from the lives of the saints, continued

to be used, the most popular subject being the Madonna with the Christ Child, represented as an earthly mother or in more divine attitudes. The more important subjects of Christian iconography are treated under separate titles, like CHRISTIAN ART, JESUS CHRIST IN ART, HOLY FAMILY. For the important part played by emblems and symbols in iconography, see the article SYMBOLISM, and such special articles as AUREOLE, NIMBUS, ETC.

Bibliography. The foundations of the modern science of Christian iconography were laid by Didron, *Iconographie chretienne, grecque et latine* (Paris, 1845, Eng trans in Bohn's Library, based on the treatise of the Byzantine monk Dionysos (London, 1851). Consult Durand, *Histoire de Dieu, iconographie des personnes divines* (Paris, 1844), and Wessely, *Iconographie Gottes und der Heiligen* (Leipzig, 1875). The best modern works are Barbier de Montault, *Traité d'iconographie chretienne* (Paris, 1890), Detzel, *Die christliche Ikonographie* (Freiburg, 1895). There is no scholarly work on the subject in English, but a number of popular treatises, such as A B Jameson, *Sacred and Legendary Art* (2 vols, London, 1863), C E Clement, *Angels in Art* (Boston, 1898), *Saints in Art* (ib, 1899), N R E Bell, *Lives and Legends of the Evangelists, Apostles, and other Early Saints* (New York, 1901), id, *Lives and Legends of the Great Hermits and Fathers of the Church* (ib, 1902). A good brief manual, alphabetically arranged, is by Liefmann, *Kunst und Heilige* (Jena, 1912). For iconography in the sense of classical portraiture, consult the monumental works of Visconti *Iconographie grecque* (3 vols, Paris, 1808), *Iconographie romaine* (3 vols, ib, 1818-20), Bernoulli, *Romische Ikonographie* (Stuttgart, 1882-91), *Griechische Ikonographie* (Munich, 1901).

ICONOSTASIS, i'kō-nōs'ta-sis. A screen in a Greek church or basilica, separating the sanctuary from the rest of the church, so called from the pictures (*icons*) of Christ, the Virgin, and saints usually placed upon it. It is usually a solid screen, with three doors hung with curtains which are dropped during the celebration of the Mass. The open screen of columns in St Mark's at Venice is often called the iconostasis, but with doubtful propriety. See BYZANTINE ARCHITECTURE, CHURCH.

ICTEROHÆMATURIA, ikt'ēr-ō-hēm'a-tū-rī-a (Neo-Lat, from Gk *iktēpos*, *ictēros*, jaundice + *haima*, *haima*, blood + *ouron*, *ouron*, urine), CARCEAG OR PIROPLASMOSIS OF SHEEP. A malignant disease of sheep in Europe, due to the action of (*Piroplasma*) *Babesia ovis*, a parasite of the red blood corpuscles closely related to that of Texas fever. In nature this protozoan parasite is transmitted from diseased to healthy sheep by a tick, *Rhipicephalus bursa*. The chief symptoms are fever, constipation followed by diarrhœa, bloody urine, jaundice of the eyelids, nostrils, and sometimes of the skin; and paralysis of the hind quarters. During the progress of the disease there is a decrease in the number of red blood corpuscles and an increase in the number of white corpuscles. Post mortem examinations reveal hemorrhagic inflammation, an acute swelling of the spleen, and parenchymatous degeneration of the liver and kidneys. The disease occurs in restricted localities, where it causes serious losses of sheep. It appears to be safe, however, to raise goats on such infected areas. Recovery from the disease conveys to

the sheep an immunity of long duration against new infection. Consult Hutyra and Marek, *Special Pathology and Therapeutics of the Diseases of Domestic Animals*, vol 1 (Amer ed, from 3d rev Ger ed, 2 vols, Chicago, 1912).

ICTERUS. See JAUNDICE.

ICTINUS (Lat, from Gk. *iktinos*). The chief architect of the age of Pericles, designer of the Parthenon (qv) at Athens, the great hall for the mysteries (Telesterion) at Eleusis (qv), and the temple of Apollo Epicurius at Phigalia (qv, see also PHIGALIAN MARBLES). He is said to have written an architectural treatise on the Parthenon.

IDA (Lat, from Gk *Idē, Idē, "Ida, Ida*). A mountain range of Asia Minor, extending through Phrygia and Mysia, now known as Kaz Dag. The Granicus, the Simois, the Scamander, and other streams famous in ancient story flowed from its sides. The highest peak was Mount Gargarus, 5748 feet, near the plain of Troy. Ida was an ancient seat of the worship of Cybele, who was hence called *Idæa Mater*. There was another Ida, almost equally famous, in Crete. This is now called Psiloriti. It rises to a height of about 8000 feet above sea level. Zeus is said to have been nurtured in a cave in this mountain. See JUPITER.

IDA. The princess, in Tennyson's poem of that name.

IDÆI DACTYLI (Lat, from Gk *Idæoi Daktuloi, Idæoi Daktuloi*). Like the Corybantes and the Curetes, the Idæi Dactyls were attendants upon Cybele (qv), and were originally connected with Mount Ida in Phrygia, whence they were transferred to Mount Ida in Crete, there they watched the infant Zeus. (See IDA). They are supernatural metal workers (their names meant Furnace, Smith, Anvil, etc). They seem to have derived the title "dactyls" from their ready fingers (compare *daktylos*, finger). Some regard them as idealized inhabitants of the region, which abounds in metals. Their number is given as 5, or 10, or sometimes even 100. In Greece they appear only at Olympia, where they seem to have been brought from Crete and were identified with Hercules and four brothers who first competed in the foot race.

IDA GROVE. A city and the county seat of Ida Co, Iowa, on the Maple River, 80 miles by rail east by south of Sioux City, on the Chicago and Northwestern Railroad (Map Iowa, B 2). It is the commercial centre of a fertile agricultural and stock-raising district and has grain elevators, a flour mill, two hospitals, a cigar factory, cement-block works, etc. A municipal heating and electric-lighting plant is in successful operation. Pop, 1900, 1967, 1910, 1874.

IDAHO, i'dā-hō (N. Amer Indian, gem of the mountains, or sunrise mountains). One of the Western States of the American Union, lying between lat 42° and 49° N and long 111° and 117° W. It is bounded on the north by British Columbia and Montana, on the east by Montana and Wyoming, on the south by Utah and Nevada, and on the west by Oregon and Washington. The extreme length from north to south along the west boundary is 483.5 miles. The width varies from about 45 miles in the north to 310 miles in the south. Its area is 84,000 square miles, including 534 square miles covered by lakes.

Topography. The surface of Idaho is greatly

diversified. Almost the entire State is in the drainage area of the Columbia River and is naturally divided into two sections by the Salmon River Mountains, which cross it from east to west at about 45° N. All rail communication between north and south Idaho is (1914) by means of lines running for a large part of the distance outside of this State. The elevation varies from 738 feet at Lewiston, where the deep cañon of the Snake leaves the State on the west border, to the snow-clad peaks of the Sawtooth Mountains, over 12,000 feet high. The general elevation is from 2000 to 7000 feet.

The mountain systems are numerous and irregular, including the Bitter Root Mountains and continental divide in the north, rising to an elevation seldom greater than 6500 feet, while to the south some of the peaks reach 11,000 feet, the Salmon River and Sawtooth ranges (central), containing the loftiest summits and noted for their rugged character and alpine scenery, and many minor ranges with distinct names.

The dominating physiographic feature of south Idaho, and the one most affecting its economic development, is the vast Snake River plain, stretching in a curved course, concave to the north, quite across the State, in a belt 50 to 75 miles wide and 350 miles along its medial line. The elevation gradually increases from 2114 feet at Weiser on the west to 4959 feet at St. Anthony on the east. It was built up principally of lava outpoured in great horizontal sheets and contemporaneously by lake and stream sedimentation and by æolian deposits. The Snake River (Lewis Fork) traverses it a part of the distance in box cañons, but in other portions builds up flood plains. The characteristic vegetation is an arborescent growth of sagebrush (*Artemisia tridentata*), which with the scarcity of water has given the plain a desert aspect. In reality the soil of great areas becomes wonderfully fertile upon irrigation, and it is this possibility which is the controlling factor in the settlement of south Idaho. A number of streams, as Big and Little Lost rivers, Birch and Camas creeks, reach the Snake River plain only to disappear.

Water power on a great scale constitutes one of the State's leading resources. Modern plants have been installed along the Snake at American Falls, the Minidoka Dam, Shoshone Falls, Swan Falls, Salmon Falls, the Thousand Springs, on the Malade at its mouth, and at Post Falls on the Spokane. In each case several thousand horse power are developed, but this is less than 3 per cent of the possible development throughout the State.

In the north there are numerous lakes, the largest of which are Cœur d'Alene, Pend Oreille, and Priest. In the center are the Payette lakes and in the southeast, on the Utah line, Bear Lake.

Climate. Idaho enjoys a milder climate than its latitude and altitude would indicate, through the effect of the mild conditions of the north Pacific on the one side and the protection of the great continental divide on the other. In the north the climate is ordinarily free from extremes of heat or cold, owing to the proximity of the Pacific Ocean and the occurrence of chinook winds. In south Idaho the climate is varied in the extreme. There are large areas where the snow seldom remains long and flowers bloom in January, while in the

near-by mountains a fire is needed almost every evening in the year. Normal annual precipitation ranges from 8 inches in part of the Snake River plain to 40 inches in the Bitter Root Mountains. The heavy precipitation of the mountains comes largely in the form of snow and is stored for summer use in irrigation of the plains and valleys below. The average highest temperature attained throughout the State in summer is 100.8° F., while the average lowest temperature in winter is -21.5° F. The mean annual temperature is 45.5° F.

Soils. North Idaho is noted for the fertility of the famous Palouse soil and that of the Nez Percé and Camas prairies, produced by disintegration of the lava outflows and by æolian action. These are famous for their production of macaroni wheat. The soils of the broad valleys of the Panhandle, black in color and rich in vegetable mold, are exceptionally fertile. The soils of south Idaho are exceptionally well supplied with all elements of fertility, except in regions of deficient rainfall which are low in humus and nitrogen.

Geology. Taking the State from north to south, in the Panhandle we have the Paleozoic sediments to the east, and some granites and schistose rock to the west in the neighborhood of Priest Lake. The sediments extend to about the north boundary of Latah and Clearwater counties, where they join the granite area to the east and the basalt to the west. The granite area extends south almost to the Snake River, but is complicated with large areas of Paleozoic sediments and Archean gneisses towards the Montana boundary. The basalt area extends south from Latah County into Washington and Oregon and thence up the Snake River almost to the eastern boundary and also south to the Nevada line. In the extreme southeastern corner there is a complex of sedimentary rock, mainly Carboniferous limestone. Glacial action is marked in many parts of central and north Idaho.

Flora and Fauna. See paragraphs on these respective topics under the article ROCKY MOUNTAINS.

Mining. The State has valuable mineral resources, many of which have not been fully developed. The center of the industry is the Cœur d'Alene lead-silver mining districts in Shoshone County. Lead, the mineral product of chief value, constitutes approximately 60 per cent of the State's total mineral production, which in 1914 was 345,000,000 pounds, valued at \$13,198,000, the State ranking second only to Missouri in the production of lead ores. Silver is second in importance among the mineral products, Idaho being outranked only by Nevada, Utah, and Montana. The mine yield of silver in 1914 amounted to 13,000,000 ounces, valued at more than \$7,115,000. Nearly all the silver is derived from lead ore and concentrate. A considerable amount of gold is produced from both placer and quartz mines, the product of 1914 being valued at \$1,115,000. The gold production from quartz mines has decreased, but gold output from dredging has increased, 35 per cent of the gold is produced in Boise County, which leads Owyhee and Lemhi counties in the order named. Idaho's importance as a producer of copper is increasing, the output in 1913 being 9,592,966 pounds, valued at \$1,486,910. The production fell off in 1914 to 5,500,000 pounds, of \$724,000 value. About 60 per cent of this

mineral comes from Shoshone County. Zinc production amounted in 1914 to 19,307 short tons. Other mineral products included clay products, coal (lignite), gem materials, lime, mica, phosphate rock, salt, sand, gravel, sand-lime brick, and stone. A non-metallic resource of great promise is phosphate, found mostly in the southeastern part of the State. The total mineral products in 1913 were valued at \$24,565,826. In 1914 the products of gold, silver, copper, lead, and zinc were valued at \$24,141,000. In that year there were 384 producing mines.

Forests Approximately one-third of Idaho is covered with timber. The total stand is estimated by the government at 129,000,000,000 feet board measure. The species of commercial value belong almost wholly to the coniferous group and occupy the more mountainous portions. In the northern part, however, in the valleys of some of the larger streams and on the flat, marshy lands adjacent to lakes, the black cottonwood (*Populus trichocarpa*) forms dense stands of merchantable timber of large size. This is the only hardwood growing in merchantable quantities.

The coniferous species, discussed in the order of their importance, are the western white pine (*Pinus monticola*) in the lower valleys and the northern slopes (to an elevation of 4500 feet) of all the northern counties, yellow pine (*Pinus ponderosa*), occupying the drier regions (at elevations below 5000 feet) supporting tree growth, and also the southern slopes of the white-pine belt, comprising nearly 40 per cent of the total stand of merchantable timber; western red cedar (*Thuja plicata*), coextensive with the white pine, but also found farther south on the eastern side of this State, Douglas fir (*Pseudotsuga taxifolia*), coextensive with the yellow pine but found also at higher elevations, western larch (*Larix occidentalis*), found associated with the white and yellow pine and Douglas fir, white fir (*Abies grandis*), scattered generally over the entire timbered area, Engelmann spruce (*Picea engelmannii*), confined to the northern slopes, lodgepole pine (*Pinus contorta-murrayana*), confined to the dry areas, western, or lowland, hemlock (*Tsuga heterophylla*), which grows to large size in the extreme north, lumber pine (*Pinus flexilis*); and western juniper (*Juniperus occidentalis*), on the north slopes of the hills in parts of the arid belt in the south.

Approximately 20,000,000 acres of Idaho land is included in national forests, and over 4,000,000 acres, owned mostly by large corporations, is under the protection of the North Idaho Forestry Association, which is composed of four smaller timber protective associations. In 1909, 4036 farms reported forest products to the value of \$1,280,512.

Agriculture By far the greater portion of the agricultural land is found in the plains on the banks of the Snake River. When irrigated, these prove to be wonderfully fertile. On the uplands heavy yields of wheat are secured without irrigation. On the alluvial bottoms and the bench lands of the small valleys in the Rocky Mountain portion of the State there are numerous areas of irrigated and dry farmed lands.

Of the total approximate land area of 53,346,560 acres in 1910, there were, in farms, 5,283,604 acres, in improved land in farms, 2,778,740 acres. The number of all farms in 1910 was 30,807 compared with 17,471 in 1900.

The average acres per farm decreased from 183.4 in 1900 to 171.5 in 1910. The value of farm property in 1910 was \$305,317,185, compared to \$67,271,202 in 1900. Another great increase was in the average value of property per farm, which was \$9911 in 1910 and but \$3850 in 1900. The average value of farm per acre in 1910 was \$41.63 and, in 1900, \$11.07. Of the State's entire land area in 1910 99 per cent was in farms. Only five counties had more than one-fifth of their land in farms in that year. One of the striking characteristics of the State's agriculture is the presence of great areas of semiarid lands utilized, if at all, only for grazing purposes, these districts being divided into large ranches, frequently exceeding 100,000 acres in extent.

In 1910, 27,619 farms were operated by owners and managers and 3188 by tenants. A great majority of these have been acquired by their owners or operators from the government or private corporations in the form of homesteads, Carey Act entries, desert-land entries or irrigated farms, the actual number of farms in the hands of tenants doubling in the decade 1900-10. In 1910 four-fifths of the farmers were native whites, the foreign-born white farmers immigrating principally from Germany, Sweden, England, Denmark, and Canada. The general character of the agricultural products in 1914 is indicated by the following table.

LEADING CROPS	Acreage	Prod bu	Value
Corn	19,000	589,000	\$424,000
Wheat	549,000	14,362,000	12,495,000
Oats	332,000	14,608,000	5,551,000
Barley	185,000	7,030,000	3,515,000
Rye	3,000	60,000	40,000
Potatoes	24,000	5,270,000	2,530,000
Hay	705,000	+1,868,000	13,636,000

*Tons

It will be noted that cereals, hay, and forage constitute the larger part of the crop production, the remainder consisting mostly of potatoes and vegetables, forest products, and fruits and nuts. In 1909 the product of sugar beets was valued at \$813,604. Orchard fruits were produced in the same year to the value of \$863,516. This total included apples, peaches, nectarines, pears, plums, prunes, cherries, and apricots. Strawberries, which are the most important small fruit, yielded 953,723 quarts, valued at \$92,904 in 1909, out of a total value for all small fruits of \$201,525. In 1912 the estimated acreage of orchards was 142,773, 40,000 of these being estimated to be fruit bearing. The estimated value of fruit products in 1912 was \$3,000,000, the product being shipped principally to Chicago and eastern markets and to Europe.

Stock Raising The estimated acreage of pasture land in Idaho is over 25,000,000, indicating that the cattle-raising industry is still of great importance, although short summers and depth of winter snows in the north and mountainous parts increase considerably the expense, confining the most productive stock-raising territory to the valleys along the Snake River. Estimates for Jan 1, 1914, place the number of dairy cows at 112,000 and other cattle at 354,000. The total value of all cattle for 1912 was \$22,403,000. The estimated number of horses in 1914 was 224,000, valued at \$22,464,000. The estimated number of mules in the

same year was 4000, valued at \$412,000. The estimated number of sheep in 1914 was 2,981,000, valued at \$12,520,000. In 1910 fowls of all kinds on farms numbered 1,053,876, valued at \$598,190. In 1909 the production of eggs amounted to 5,088,988 dozen, valued at \$1,213,724. In 1909, 20,861,072 gallons of milk and 3,542,135 pounds of butter, valued at \$982,397, were produced on farms. The total value of milk, creamery butter, and cheese was \$1,962,500.

Irrigation. The occurrence of widespread

yards, and has a reservoir capacity of 230,000 acre feet.

Manufactures. Since its admission as a State in 1890, the manufacturing industries of Idaho have more than kept pace with the growth of population. Industries, as a whole, showed a large percentage of increase during the five-year periods 1899-1904 and 1904-09. The accompanying table shows the most important facts in relation to the manufacturing industries in 1909, in comparison with 1904.

COMPARATIVE SUMMARY FOR 1909 AND 1904

THE STATE—ALL INDUSTRIES COMBINED AND SELECTED INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Cost of materials	Value of products	Value added by manufacture
			Total	Wage earners (average-number)					
All industries	1909	725	9,909	8,220	\$32,477	\$5,498	\$9,920	\$22,400	\$12,480
	1904	364	3,791	3,061	9,689	2,059	4,069	8,769	4,700
Brick and tile	1909	36	347	286	800	179	109	444	385
	1904	19	95	72	91	45	27	113	86
Butter, cheese, and condensed milk	1909	18	159	118	231	77	681	884	203
	1904	16	35	13	44	10	136	172	36
Cars and general shop construction and repairs by steam-railroad companies	1909	5	870	849	468	672	659	1,366	707
	1904	8	753	713	183	539	326	914	588
Flour-mill and gristmill products	1909	57	242	125	2,038	91	2,025	2,480	455
	1904	28	127	84	685	67	1,315	1,584	269
Liquors, malt	1909	11	111	74	1,231	65	234	698	464
	1904	14	86	61	459	54	74	303	229
Lumber and timber products	1909	256	5,904	5,212	17,872	382	3,345	10,689	7,344
	1904	107	1,670	1,449	3,516	3,876	906	3,142	2,286
Printing and publishing	1909	132	753	468	1,106	373	243	1,148	905
	1904	91	398	253	488	178	107	549	442
All other industries	1909	210	1,518	1,088	8,731	659	2,624	4,691	2,067
	1904	81	627	411	4,223	290	1,178	1,992	814

areas of level or gently sloping fertile land combined with deficient rainfall, notably in the Snake River plain and its tributary valleys, has given opportunity for many large irrigation projects, especially those built by private capital under the Carey Act (1894) and by the Federal government under the Reclamation Act (1902). At Milner is a rock-fill dam across the channel of the Snake, which is the diversion dam for the main canals of two of the largest Carey Act projects as yet constructed, the Twin Falls North Side and Twin Falls South Side, each irrigating over 200,000 acres. Another rock fill is the Reclamation Service Dam across the Snake at Minidoka. It diverts water for 119,000 acres, 49,000 of which are reached by pumping, with a maximum lift of 90 feet. Ten thousand electric horse power are generated at this dam, of which 7000 are used in summer to run the pumps. Near Twin Falls are two high-storage dams for Carey Act projects—the Salmon River Dam, a concrete structure 220 feet high, and the Oakley Dam, an earth dam with concrete core 143 feet high. In the Arrow Rock Dam, a storage dam built by the government across the Boise River, Idaho has the highest masonry dam in the world. It is 351 feet high, crest length 1060 feet, concrete required 580,000 cubic

The total number of wage earners in 1909 was 8220. Of these 8035 were men and 155 women. There were only 30 persons under 16 years of age employed. For the majority of the wage earners the prevailing hours of labor in 1909 were 60 a week, 24.1 per cent of the total being employed in establishments where they work less than that number of hours, and only 10 per cent being employed where they work longer. Boise, the capital and metropolis, is not important as a manufacturing centre. In 1909, 6.9 per cent of the establishments, 5 per cent of the wage earners, and 7.4 per cent of the value of products were found in that city.

Transportation. In recent years there has been considerable building of railroads, the mileage increasing from 1740 on Jan. 1, 1907, to 3577 in 1914, these figures including single and double tracks, yard tracks, and sidings. The Oregon Short Line passes through the southern part of the State and has the greatest length of line, 1336 miles. The Northern Pacific with 320 miles of track, the Great Northern with 80, and the Chicago, Milwaukee, and Puget Sound with 180, pass through the northern portion. The Oregon-Washington Railroad and Navigation Company has 135 miles of track, and the Spo-

kane International Railway Company 122 miles. A Public Utilities Commission has general charge of the regulation of railway rates. The development of mines within the great central part of the State has stimulated the construction of wagon roads and trails, but these are not adequate to the needs of the district.

Banks. There were, on June 4, 1913, 55 national banks, with a capital of \$3,495,000 and deposits aggregating \$29,231,000, 118 State banks, with deposits subject to check amounting to \$8,677,451, and savings banks with 962 depositors, with deposits subject to check aggregating \$47,710, and savings deposits amounting to \$183,495. In addition there were 11 loan and trust companies, with deposits subject to check amounting to \$1,533,218 and savings deposits amounting to \$276,046. Private banks numbered 6, with deposits of \$55,534.

Government. The present constitution was adopted by a convention held in 1889. Up to 1913 there were 22 amendments. An amendment to the constitution may be proposed in either branch of the Legislature, and, if agreed to by two-thirds of all the members of each House, voting separately, it shall be presented to the electors at the next general election. A convention for the revision or amendment of the constitution may be held upon recommendation to the electorate by vote of two-thirds of the members elected in each branch of the Legislature and majority vote of the electors at the next general election. The convention shall consist of a number of members not less than double the number of the most numerous branch of the Legislature.

Legislative.—The legislative power is vested in a Senate and House of Representatives. The Senate consisted in 1914 of 33 members and the House of 61 members. The Legislature has the power of increasing the number of Senators and Representatives. The House is composed of at least one member from each county, and it must never exceed three times the membership of the Senate. Both Senators and Representatives are elected for a term of two years. Sessions of the Legislature are held biennially, commencing on the first Monday after the first day of January. On Nov 5, 1912, the people approved an amendment providing for the initiative and referendum.

Executive.—The executive department consists of the Governor, Lieutenant Governor, Secretary of State, State Auditor, Attorney-General, and Superintendent of Public Instruction, each holding office for two years. The Governor, Lieutenant Governor, and Attorney-General must be 30 years of age at the time of their election. The Governor, Secretary of State, and Attorney-General constitute a board of pardons. The Governor has the usual veto power, and the Lieutenant Governor is President of the Senate. The Governor, Secretary of State, and Attorney-General constitute a board of State-prison commissioners, and the Governor, Superintendent of Public Instruction, Secretary of State, Attorney-General, and State Auditor constitute a State board of land commissioners which has direction, control, and disposition of the public lands under such regulations as may be prescribed by law.

Judiciary.—The judicial power is vested in a court for the trial of impeachments, a supreme court, district courts, probate courts, courts of justices of the peace, and such other

courts inferior to the supreme court as may be established by law for any incorporated city or town. The court for the trial of impeachments is the Senate. The supreme court consists of five justices, a majority of whom is necessary to make a quorum or pronounce a decision. The justices of the supreme court are elected by the electors at large. The term of office is six years. The State is divided into nine judicial districts, for each of which (except the third, fourth, and eighth) a judge, whose term of office is four years, is chosen by the qualified electors thereof. In the excepted districts there are two judges. District courts must be held in each county at least twice in each year. The Legislature has the power to reduce or increase the number of districts, district judges, and prosecuting attorneys. A prosecuting attorney is elected for each county by the qualified electors thereof and holds office for two years. The judges of the district courts are required on the first day of July in each year to report in writing to the justices of the supreme court such defects or omissions in the laws as then knowledge and experience may suggest, and the justices of the supreme court shall, on or before the first of December of each year, send a report in writing to the Governor, to be by him transmitted to the Legislature, on such defects and omissions in the constitutional laws as they may find to exist.

Suffrage and Elections.—Every male and female citizen of the United States, 21 years of age, who has actually resided in the State for six months and in the county 30 days, if registered as provided by law, is a qualified elector. In accordance with the provisions of a direct primary law enacted in 1909, all candidates for Congress and all elective State, district, and county officers are nominated at primary election held biennially. Each candidate for office, or some qualified voter in his behalf, is required to file a nomination paper at least 30 days and not more than 60 days prior to the primary election. Provision is made on the official ballot for voters to signify first or second choice of candidates for the respective offices. Candidates are required to file itemized statements of receipts and disbursements. Nominations may be made at conventions or primary meetings, they may also be made by petition. Provision is made for the registration of voters prior to elections, and crimes against the elective franchise, including bribery, illegal registration, etc., are severely punished. In 1909 the Legislature also passed a measure providing for elections under local-option law. On Nov 5, 1912, a constitutional amendment providing for the recall of all public officers except judicial officers was carried.

Local and Municipal Government.—Any county or incorporated city or town may make and enforce within its limits all such local police, sanitary, and other regulations as are not in conflict with its charter or with its general laws. No county, town, city, or other municipal corporation may become a stockholder in any joint-stock company, corporation, or association whatever, or raise money for, or make donation or loan its credit to, or in aid of, any such company or association. The county officers are county commissioners, the sheriff, county treasurer, probate judge, county superintendent of public instruction, county assessor, a coroner, and a surveyor. Cities and towns are permitted

to adopt a commission form of government. The Legislature in 1911 enacted a commission charter for cities of 2500 or more if they adopt the act at a special election. The charter provides for nomination by petition, for initiative, referendum, and recall. It may be abandoned after six years by vote at a special election called by a petition of 25 per cent of the voters.

Other Constitutional and Statutory Provisions—No charters of incorporation are granted, amended, or exchanged by special law except for such municipal, charitable, educational, penal, or reformatory corporations as may be under the control of the State. There is a bureau of immigration and labor statistics, which is under the charge of a commissioner of immigration, labor, and statistics, appointed by the Governor. Not more than eight hours' actual work constitutes a lawful day in all municipal undertakings. A county local option law was passed in 1909, and a strong search and seizure law was passed in 1911. In 1913, 21 of the 33 counties were "dry." There is an employers' liability law restricting the defenses of fellow servant and assumption of risk. The sanitary laws provide for the inspection of hotels and for sanitation in dairies and forbid the sale of adulterated, misbranded, or impure foods or drugs. In 1913 the Legislature enacted a law providing for a Public Utilities Commission, consisting of three members, and the law closely follows that of California and Washington as regards powers and duties. A State Tax Commission consisting of the same members as the Public Utilities Commission was also created. A Blue Sky Law was also passed.

Finance. The report of the State Treasurer for the biennial period ending Dec 1, 1914, showed a balance on hand at the beginning of the year of \$1,091,151. The receipts for 1913 amounted to \$2,143,122, and the disbursements to \$2,169,517, leaving a balance at the end of the fiscal year of \$165 85. The chief expenditures are for the expenses of State government and the maintenance of State institutions. The chief sources of income are from general tax levies, receipts from the Secretary of State's Department, interest on current funds, and receipts from sundry other departments. The amount of bonded indebtedness at the end of the fiscal year was \$2,421,450. A State board of equalization, consisting of the Governor, Secretary of State, Attorney-General, State Auditor, and State Treasurer, meets each year to equalize the value of property. The total value of all property for assessment purposes in the year 1912 was \$418,780,394. In 1911 the tax laws were revised.

Militia. The militia consists of a regiment of infantry and one detachment of sanitary troops. The number of enlisted men in 1913 was 790, and the officers numbered 50. The State designation is the National Guard of Idaho. The total number of males of militia age in 1910 was 86,384.

Population. The population has steadily increased from its earliest settlement, the figures by decades being as follows: 1870, 14,999; 1880, 32,610; 1890, 88,584; 1900, 161,772; 1910, 325,594. The estimated population on July 1, 1914, was 395,407. Of the total population, in 1910, 185,546 were males and 140,048 females. The population per square mile in 1910 was 3.9 per cent. The urban population was 69,898, and the rural population 255,696 in 1910. In 1910

the native white population numbered 203,599; the native whites of foreign or mixed parentage in 1910 numbered 75,195; and the foreign-born whites, 40,427. The Indian population of the State in 1910 numbered 3488, compared with 4226 in 1900. There were, in 1910, 859 Chinese and 1363 Japanese. The largest city and the capital is Boise. The population in 1910 was 17,358, compared with 5597 in 1900. The other cities with a population of 2500 and over in 1910 are Coeur d'Alene, 7291; Pocatello, 9110; Lewiston, 6043; Twin Falls, 5258 (incorporated in 1908); Idaho Falls, 4897; Nampa, 4205; Caldwell, 3543; Moscow, 3670; Wallace, 3000; Sandpoint, 2993 (incorporated in 1907); Weiser, 2600.

Indians. There were, in 1913, 4089 Indians. There were four reservations—Coeur d'Alene, Fort Hall, Lapwai, and Lemhi—with a total area of 482,130 acres. The tribes include the Coeur d'Alene, Kutenai, Pend d'Oreille, Spokane, Bannock, Shoshoni, and Nez Percé. Schools for these Indians are maintained at Coeur d'Alene, Kalispel, Kootenai, and Fort Hall. The total area of Indian lands in the State is 770,706 acres, of which 289,188 acres had been allotted in 1913, and 481,518 acres were unallotted. The total number of Indian children in the schools in 1913 was 663 out of a total of 970 of school age.

Education. In matters relating to education Idaho is progressive. The Legislature of 1911 passed a series of laws which practically revised the existing code, and these laws were further amended in 1912. A State board for the general supervision, government, and control of all educational institutions was created, this board constituting also the board of regents of the University of Idaho and exerting wider powers than the body which was in existence before its creation. The office of Commissioner of Education was established to propose and execute beneficial educational policies and to have general supervision over the educational institutions and public schools of the State. The State board is appointed by the Governor for a six-year term. The superintendent, the executive officer of the board, must be a graduate of an approved normal school, college, or university. Superintendents of public instruction are elected in each county biennially. The system of issuing certificates to teachers was revised and greatly improved. Provision was made for the holding of teachers' institutes annually under the direction of the county superintendent, and for a commission of summer normal schools—one at Pocatello, one at Boise, and one at either Coeur d'Alene or Sandpoint. Provision was also made for the establishment of rural high schools. The compulsory education law was amended and strengthened. The State board was given power to formulate rules and regulations for building schoolhouses, and important changes were made in the method of apportioning the school fund. A law forbids the employment of children under 14 during school hours and before 6 A. M. or after 9 P. M. Children between 14 and 16 are placed under the same limitations unless they have certain educational requirements.

The total school population (ages 6 to 20) according to the thirteenth census was, in 1910, 96,819. Of these, 66,779 were in attendance in that year. The enrollment in schools on June 30, 1912, was 84,791, and the average daily attendance was 66,359. There were 2710 teachers,

of whom 2021 were women and 689 men. The average monthly salary paid to women teachers was \$68.88 and to men teachers \$87.21. The total number of schoolhouses was 1287, and the estimated value of all school property was \$7,090,106. The total number of city and town high schools was 102, and rural high schools 15. The total expenditures in 1912 amounted to \$3,225,496. Of a total population in 1910 of 325,594, 3416 were illiterate, or a percentage of 1.5 per cent. Institutions of higher learning include the University of Idaho at Moscow, the Academy of Idaho at Pocatello, Lewiston Normal School at Lewiston, Albion Normal School at Albion, Industrial Training School at St. Anthony, the State School for Deaf and Blind at Gooding, and the College of Idaho at Caldwell.

Charities and Corrections. Institutions under State control include the Soldiers' Home at Boise, the State Penitentiary at Boise, the State Insane Asylum at Blackfoot, North Idaho Insane Asylum at Orofino, and the State Sanitarium at Nampa. In 1911 the Legislature passed a measure authorizing the establishment of a State sanitarium for feeble-minded and epileptics near Nampa, and created a prison commission to investigate conditions in the State Penitentiary.

Religion. In religion Idaho is, like Utah, strongly Mormon. Roman Catholics are the next strongest, and the Methodists, Presbyterians, and Baptists follow in the order named.

History. The first white explorers of Idaho were Lewis and Clark in the first decade of the nineteenth century. A mission is reported to have been established at Cœur d'Alene in 1842, but for many years after that the region was visited only by hunters and prospectors. It was organized as a Territory on March 3, 1863, but with an area more than three times as large as at present, since it included the whole of Montana and nearly all of Wyoming. In May, 1864, a part was set off to Montana, and in 1868 Wyoming was organized. The discovery of gold in 1882 at Cœur d'Alene in the northern part of the State was followed by a large immigration. In 1889 a new constitution was adopted, and the University of Idaho was established at Moscow. On July 3, 1890, Idaho was admitted to the Union. The presence of a large number of Mormons in the southern part of the State excited alarm and in 1883 led to hostile action on the part of the Legislature. A law depriving professed polygamists of the right to vote was sustained by the United States Supreme Court. In 1893 the heads of the Mormon church rejected polygamy as an essential element of their creed, the anti-Mormon restrictions were removed, and all single-wived Latter Day Saints were admitted to the ballot. From May to September, 1892, a miners' strike at Cœur d'Alene resulted in bloody conflicts between union and nonunion workers. Federal troops were sent to the scene of disturbance, and military law was proclaimed. The strike failed, but dissatisfaction persisted among the mine workers and in April, 1899, blazed out in renewed strikes and riots, necessitating again the use of United States troops. The bitter feeling engendered by the long conflict persisted and resulted in Dec. 30, 1905, in the assassination of ex-Governor Steunenberg. The chief officials of the Western Federation of Miners, William H. Moyer, president, William D. Haywood, and George W. Pettibone, accused

of complicity, were arrested in Denver and taken to Boise. An appeal was taken to the United States courts including the Supreme Court for a writ of habeas corpus on the ground that they had been unlawfully taken from the jurisdiction of the State of Colorado, but the writ was refused. The evidence against them consisted chiefly of a remarkable confession made by Harry Orchard, whose real name was Alfred E. Horsley, who testified to having taken part in a number of murders, assaults, and explosions in Colorado, Idaho, and other Western States while in the employ of the officials of the Western Federation of Miners. He testified further that he had placed the bomb which killed Governor Steunenberg after several previous attempts had failed. Haywood and Pettibone were acquitted, and the case against Moyer dropped. Orchard was placed on trial, pleaded guilty, and was sentenced to death. The State Board of Pardons commuted the sentence to imprisonment for life. The year 1910 was marked by the most disastrous forest fires in the history of the State. These fires began early in August and raged in the Cœur d'Alene region and around the towns of Wallace, Murray, and Mullan for several weeks. Wallace and several smaller towns were almost entirely destroyed, and many lives were lost. In 1912 constitutional amendments providing for the initiative, referendum, and recall were carried by large majorities. Statutes relating to the bonded indebtedness of the State and taxation were also submitted and carried. An amendment providing for increased membership of the Legislature was carried. The Republicans elected all representatives to Congress, and William E. Borah was reelected United States Senator on Jan. 14, 1913. Senator Heyburn died on Oct. 17, 1912, and the Governor appointed Kirtland I. Peiky to fill out the unexpired term until his successor could be elected. The Legislature of Jan. 24, 1913, elected James H. Brady, former Governor, to fill out the term, which expired on March 3, 1915. The State has, by the apportionment of 1910, two members in the House of Representatives, prior to that year it had but one.

In national elections Idaho was carried by the Democrats, or the Democrats and Populists in fusion, in 1892, 1896, 1900, and 1912, and by the Republicans in 1904 and 1908.

A comparison of the vote in the presidential elections of 1908 and 1912 follows:

	1908		1912
Taft, Rep.	52,606	Wilson, Dem.	33,921
Bryan, Dem.	36,080	Taft, Rep.	32,810
Chapin, Prohib.	1,740	Roosevelt, Prog.	25,530
Debs, Soc.	6,243		

In 1912 Haines, Republican, was elected Governor with 35,134 votes against Hawley, Democrat, with 33,992 votes. In the State elections of November, 1914, the Democrats succeeded in electing a Governor, but James H. Brady, Republican, was reelected to the Senate. The governors since its organization as a Territory have been as follows:

TERRITORIAL

William H. Wallace	1863-64
Caleb Lyon	1864-66
David W. Ballard	1866-70
Gilman Marston	{ resigned without acting
Thomas M. Bowen

IDAHO, UNIVERSITY OF A State educational institution, situated at Moscow, Idaho. It was founded in 1889, but was not opened for the reception of students until 1892. It is under the control of the State Board of Education and the Commissioner of Education and offers free instruction to students of both sexes. There are colleges of letters and sciences (including home economics, music, and forestry), engineering, agriculture, and law, and a summer session. It maintains agricultural experiment stations and has organized movable schools of agriculture throughout the State. In recent years agricultural extension, including cooperation with several counties of the State, has been developed, the headquarters being in the State House, Boise. Military drill is required of freshmen and sophomores in the university. The degrees of BA, BS, LLB, and MS in home economics, forestry, agriculture, and engineering, also MA and MS, are conferred. The attendance (1913-14) was 747. The faculty numbered about 80. The library contains about 35,000 volumes and 8000 pamphlets. The endowment consists of 286,000 acres of land, none of which can be sold for less than \$10 an acre. The buildings are valued at \$517,165, and the grounds at \$57,775. The income in 1913-14 was \$262,120. The president in 1914 was Melvin Amos Brannon, Ph D.

IDAHO FALLS A city and the county seat of Bonneville Co, Idaho, 30 miles northeast of Blackfoot, on Snake River, and on the Oregon Short Line (Map Idaho, F 6). It has excellent water power and is situated in a fertile irrigated agricultural region, for which it is the distributing centre. It has a sugar factory, and there is a Carnegie library here. The water works and electric-light plant are owned by the city. Pop, 1900, 1262, 1910, 4827.

IDAHO SPRINGS A city in Clear Creek Co, Colo., 37 miles by rail west of Denver, on the Colorado and Southern Railroad (Map Colorado, D 2). Picturesquely situated in the famous Clear Creek Cañon, at an elevation of 7543 feet, and having cold and hot soda springs,

it is one of the noted summer resorts of the State. In 1859 gold was first discovered in Colorado, at Jackson's Bar, within the present city limits. Since then the mineral production of the district has been enormous. The town has a number of concentrating mills, machine shops, lumber yards, etc., and is famed for its mining tunnels, notably the Newhouse Tunnel, one of the longest in the world. There are municipal water works and a Carnegie library. Pop, 1900, 2502, 1910, 2154.

IDALIA, i-dā'li-a, or **IDALIAN**, i-dā'li-an. An epithet of Aphrodite. See **VENUS**, **IDALIUM**. **IDALIUM** (Lat, from Gk. Ἰδαλίον, *Idalion*) A town in Cyprus, adjoining which was a forest sacred to Aphrodite, who was hence sometimes called *Idalia*. The site is the modern Daln.

IDDESLEIGH, idz'li, first EARL OF. See **NORTHCOTE**.

ID'DINGS, JOSEPH PAXSON (1857-) An American geologist, born in Baltimore, Md. He graduated at Sheffield Scientific School (Yale) in 1877, was a graduate student and assistant in mechanical drawing and surveying there until 1878, and continued his studies in geology and microscopic petrography at Columbia University and Heidelberg. From 1880 until 1892 he was in the service of the United States Geological Survey, to which he returned in 1895. In 1892-95 he was assistant professor, and from 1895 to 1908 professor, of petrology at the University of Chicago. In 1907 he became a member of the National Academy of Sciences. His government explorations were described in many reports and contributions to scientific journals. Among his more important writings are: *The Nature and Origin of Lathophyses and the Lamination of Acid Lavas* (1887), reprinted from the *American Journal of Science*; *On the Development of Crystallization in the Igneous Rocks of Washoe, Nev.* (1885), with Arnold Hague, *Rock Minerals* (1906, 2d ed, 1911), *Igneous Rocks* (2 vols, 1909-13).

IDE, id (Norw, Swed *id*, roach). A fish (*Leuciscus idus*), closely allied to the roach. It inhabits the lakes of the northern parts of Europe and ascends rivers in April and May to spawn. It is excellent for the table. A gold-colored variety, called orfe, is bred in Germany and is sold extensively for ornamental aquariums.

IDE, HENRY CLAY (1844-) An American public official, born at Barnet, Vt. He graduated from Dartmouth College in 1866. In 1876-78 he was State attorney of Vermont, and in 1882-85 member of the State Senate, and in 1884 president of the Republican State Convention. Appointed United States Commissioner to Samoa in 1891, he was for four years (1893-97) chief justice there under the joint appointment of Germany, England, and the United States. As a member of the Taft Commission, he helped to establish in 1900 civil government in the Philippine Islands, where he was subsequently Secretary of Finance and Justice (1901-04), Vice Governor (1904-05), acting Governor (1905-06), and Governor-General (1906). He was receiver for the Knickerbocker Trust Company, New York, in 1907-08 and from 1909 to 1913 was Minister to Spain. He published: *Code of Procedure in Civil Actions and Special Proceedings in the Philippine Islands* (1901); *The Land Registration Act* (1903), *The Internal Revenue of 1904 of the Philippine Islands*.

IDEA, i-dē'a (Lat. from Gk *idéa*, form, from *idéiv*, *idem*, to see, connected with Lat *videre*, to see, Skt *vid*, AS *uitan*, Eng *uit*, to know) The term "idea" has undergone a radical change of meaning in the history of psychology "Employed by Plato to express the real form of the intelligible world, in lofty contrast to the unreal images of the sensible, it was lowered by Descartes, who extended it to the objects of our consciousness in general" (Hamilton) In modern philosophy the word has a distinctly empirical flavor. Locke (q v) defines idea as "whatsoever is the object of the understanding when a man thinks," "that which the mind is applied about whilst thinking", and the English Associationist school (see ASSOCIATION OF IDEAS), failing to distinguish between existential "mental process" (q v) and logical "meaning" (q v), tended to regard the static, cognitive "idea" as the sole mental formation Current psychological usage, recognizing this distinction, emphasizes the fluid, changing character of ideas, and regards meaning as only incidentally a conscious matter, not inherent in the idea, but deriving from conscious context and determination According as an essential psychological difference between sensation and image (see IMAGINATION) is or is not admitted, ideas form a class of primary complexes made up of the latter element alone or of the two elements in conjunction, and the psychology of idea is the counterpart of the psychology of perception (q v) or is identical with it

Ideas may be formed, somewhat after the manner of the composite photograph, as the resultant of a large number of similar impressions. By the mutual inhibition of the elements of these impressions which are not identical, the idea loses definiteness of detail, while, by the repetition of the identical elements, it acquires an especial liability to associative reproduction Under the influence of abstractive determination (see ABSTRACTION) some, even of the frequently repeated elements, may be inhibited, and the ideational content may thus become less and less evidently "relevant" to its logical meaning Such an idea, which forms the characteristic complex in thought (q v), is called an "abstract" idea When, in the later stages of development, context and determination lapse from consciousness, and the idea becomes symbolic (eg, a word), it is named a "concept" Ideational masses of complex but vague contents, which require the operation of active attention to bring their constituents to separate recognition—such as our idea of the sentence that we are about to utter, or (on a still larger scale) our idea of self—are called "aggregate" ideas

Consult: Sully, *The Human Mind* (London, 1892), Ladd, *Psychology, Descriptive and Explanatory* (New York, 1894), James, *Principles of Psychology* (2 vols, 1b, 1890), Titchener, *Text-Book of Psychology* (1b, 1910), Wundt, *Grundsuge der physiologischen Psychologie* (Leipzig, 1911)

IDEALISM In philosophy, the theory that all material objects are only ideas in some mind, or the theory, developing from this one, that no reality is independent of consciousness Its ordinary antithesis is realism, or the theory that the reality of things is not dependent upon their relation to mind or consciousness In modern thought idealism found its classic expression first in George Berkeley's philosophy Locke had distinguished between the primary and the

secondary qualities of matter, the former belonging to matter in itself, and the latter being entirely subjective Berkeley argued that there is no more reason for considering Locke's primary qualities objective than his secondary qualities Hence he ranked all qualities of matter as subjective, and denied the existence of independent matter altogether, on the ground that it is an impossible abstraction Hume followed Berkeley in the denial of independent matter Kant reduced all matter to sensations actual or possible, in the subjective forms of space and time and ordered by the categories (See CATEGORY) But Kant still believed in things-in-themselves, i e, things not dependent in any way on our experience for their reality Thus, all experience for Kant was ideal, but experience does not exhaust reality Kant's immediate successors, Fichte, Schelling, and Hegel, each in his way continued Kant's view of the ideal character of experience, but declined to admit any things-in-themselves Fichte's and Hegel's idealisms were the starting points for various idealistic movements which have continued to the present day

Thus, we see that genetically modern idealism is of two fundamentally different types, the Berkeleyan and the post-Kantian, with more or less close affiliations between the two types The Berkeleyan idealism is pluralistic, in that the world of nature, the "objective world," is not considered as one but as many, each spirit having his own world in his own ideas Of these ideas some constitute his real world, others constitute his world of imaginary objects The post-Kantian idealism is monistic, there being for it one world which is contained within the "consciousness" or the "experience" of an all-inclusive spirit—the Absolute—of which finite spirits are in some sort parts The content of the Absolute's consciousness or experience, so far as it transcends finite consciousnesses or experiences, is the objective world of these finite spirits The Absolute is not the cause of the finite spirit but its complement, while Berkeley's God, the supreme spirit, has a separate and distinct equipment of ideas, and this world of ideas is the real world for other spirits only in the sense that it is the prototype of the real ideas in finite spirits God causes the finite spirits to have some ideas which correspond in the way of likeness to the contents of his own mind The Absolute is the ideal completion of all the implications of finite experiences—an ideal completion actually realized Thus, Berkeleyan idealism operates with the conception of causality as its highest category, while post-Kantian idealism operates with the categories of mutual implication, cause being only one such category and usually a subordinate one

Berkeleyan idealism has survived into post-Kantian times, but usually with modifications influenced by post-Kantian idealism In many cases, therefore, the idealists of the present day cannot be strictly classed as either Berkeleyan or post-Kantian, but they represent various degrees of synthesis or of syncretism based on these two distinct historical idealisms A detailed account of these various idealisms is impossible here For more details of system and for bibliography, see BERKELEY, HUME, KANT, FICHTE, SCHOPENHAUER, LOTZE, GREEN, T H, BOSANQUET, WARD, JAMES, ROYCE, MÜNSTERBERG, ECKEN, CAIRD, J and E, HOWISON.

IDEAS, ASSOCIATION OF See ASSOCIATION OF IDEAS

IDELER, *id'ol-ler*, CHRISTIAN LUDWIG (1766-1846) A German astronomer and chronologist, born at Gross-Biese, near Peleberg, in Prussia. After holding various offices under the Prussian government he received a professorship at the University of Berlin in 1821, and in 1829 he was made a foreign member of the Institute of France. Ideler's most important works are *Handbuch der mathematischen und technischen Chronologie* (2 vols, 1825-26, 2d ed, 1833), which was the first work that presented a clear view of the reckoning of time among the ancients, and *Die Zeitrechnung der Chinesen* (1839), a supplement to the *Handbuch*. He also wrote, in conjunction with Nolte, handbooks of the French and English languages and literatures, which passed through numerous editions—His son, JULIUS LUDWIG IDELER (1809-42), was born in Berlin and was educated in the medical department of the University of Berlin. He wrote *Meteorologia Veterum Graecorum et Romanorum* (1832), *Die Sage von Schuss des Tell* (1836), *Hermaphrodite* (2 vols, 1841).

IDENTITY (ML *identitas*, sameness, from *identicus*, same, from Lat *idem*, same) A term used in philosophy in various meanings, often confused. In a puristic sense a thing is said to be identical when it is conceived of as an unchanging unit with no internal differences. Identity in this sense is not a relation, but rather the absence of relation. Again, identity is often used as manifesting itself in similarity, but when this is done, what is supposed to differentiate it from similarity is that the identical in similar things is considered as an unchanging core of undifferentiated quality, around which the differences which distinguish the similar things are grouped. Such a view is natural to those who regard universals as having an existence of their own and getting individuation by entanglement with other universals. Thus, it may be supposed that redness is an unchanging quality, then said to be identical in all reds. Mix in a bit of an unchanging white with the red and you get pink, mix in an unchanging blue and you get purple. According to this view, the universal is identical in the first sense of the term, and things are said to be identical when they partake in identical universals. All particulars are complexes of universals, particularity is composition of the identical universals as atomic elements. Since Hegel's time it has been more usual to consider such strict identity as an abstraction. From this point of view there is no identity without diversity. Identity is thus a relation which always involves at least two terms, and the duality of the terms, with whatever individuates them, is as essential as the relation which connects the terms. Identity is, in other words, an abstraction from the concrete fact of the existence of similar things. In so far as two things are like each other, they are identical in the respect in which they are alike. But this respect in which they are alike is not to be erected into a metaphysical entity, which has independent or logically prior existence, and which then becomes differentiated in the two particulars. The existence of things in the relation of similarity is the ultimate fact, and identity is what we

get when we ignore the differences between the things and dwell only on the similarity. Consult F H Bradley, *Principles of Logic* (London, 1883), G S Fullerton, *Sameness and Identity* (Philadelphia, 1890), F H Bradley, *Appearance and Reality* (2d ed, London, 1897), William James, *Principles of Psychology* (New York, 1899), Bernard Bosanquet, *Logic* (2 vols, 2d ed, Oxford, 1911), also various authorities referred to under LOGIC.

IDEOGRAPHY (from Gk *idea* *idea*, idea + *-graphia*, *-graphia*, a writing, from *graphein*, *graphein*, to write) The art of representing ideas by graphic signs, as may be seen in the hieroglyphics (qv) found on the monumental relics of Egypt.

IDES, *idz*. See under KALENDS

IDIOCY, *id'i-5-si* (from Gk *idiōtēs*, *idiōtēs*, uncouthness, from *idiōtēs*, *idiōtēs*, private citizen, from *idios*, *idios*, connected ultimately with Lat *suius*, Skt *sia*, own) A condition of arrest of development of the brain, and, in consequence, of the intellectual faculties, of the infant or child. If the nondevelopment is such that the child is capable of feeding himself and of appreciating enough of his surroundings to avoid injury, the condition is usually termed *imbecility*. If there is no such evidence of mental capacity, *idiocy* is the term usually employed. *Feeble-mindedness* occupies an intermediate position between normality and imbecility. The defect or disease of the brain which interferes with normal evolution may be congenital or acquired, the cerebral functions may be all more or less involved. Ribot and also Sollier maintain that the slow development of the cerebral faculties is due to want of attention, that spontaneous attention is caused by affective states brought into action by sensations, and that those young children are the most attentive whose nervous systems are most easily stimulated. Hence the faculty of attention is closely related to the activity of the sensations. The greater the power of attention, the more intelligent does the individual become. In idiocy, owing to the diminution or loss of the power of attention, the perceptions aroused by sensations are more or less indefinite, and the resultant idea likewise ill-defined. Sensations become more numerous as the organism develops, and the lack of ideas and recognitions becomes more noticeable. Frederick Peterson, whose translation of Sollier we quote, sounds a warning that there are other faculties of mind, such as will and memory, which are absolutely necessary to all subsequent mental activity, and adds that lack of the power of attention, while common in idiocy, cannot be taken in any way as distinguishing this condition of mind from other forms of mental impairment. Frequently somatic and especially cranial and facial characteristics are noticeable upon the birth of the idiot, though idiocy exists also when physical evidence is wanting. An idiot may not take the breast, may cry without motive and with different notes from normal children. Deafness or blindness may be congenital. The senses of smell and of taste may be undeveloped. The movements of the eyes may be irregular. The idiot may be slow in responding to the stimulus of touch, he may not laugh, thermic sensibility is diminished, a constant rhythmic, automatic motion may be present, he may not learn to walk, and all voluntary movements may be acquired late in youth and imperfectly. Organic sensations

are blunted, including hunger, thirst, desire for defecation or urination. Lack of the faculty of attention exists, owing to defective senses which convey feeble impressions to the brain, as well as to a lack of the affective state, the internal form of attention (reflection of Ribot) is absent or deficient in the idiot. He is practically incapable of preoccupation. His instincts are defective, whether of hunger or of self-preservation, while the instinct of imitation is very strong, and the sexual instinct is seldom normal, being exaggerated, impaired, absent, or perverted. Occasionally remarkable special aptitudes are seen in idiots in the direction of music, mathematics, mechanical arts, drawing, painting, memory for facts or dates, playing certain games, and a low order of wit or drollery. It is said that the court fools and jesters of ancient times were idiots of high grade or imbeciles, until others, seeing the emolument to be obtained, studied and practiced the art. Ribot says that Sikoiski is authority for the statement that the activity and attention of normal children are mainly developed through play. Idiots for the greater part manifest little tendency to play, clinging to the simplest games of infancy and preferring solitary pastimes. Others of higher grade prefer noisy, destructive sports, and traits of brutality, selfishness, and quarrelsomeness are apparent. Civility and politeness are rarely acquired. Destructiveness, evidenced in their play, may develop into a vicious satisfaction in inflicting injury, commission of arson, or of homicide, or of self-mutilation. Sentiments and sensation are rudimentary or absent, the absence of ideas of right and wrong, the varying respect for authority, the absence of religious feeling, and the absence of veracity being especially noticeable.

It has been said that idiot children sometimes show facial characteristics at birth. They are always ungainly, uncouth, or ugly in figure, face, attitudes, or movements. Very common among them are misshapen or unsymmetrical heads, dwarfishness, lack of proportion of the limbs, stooping and slovenly postures, deformities of the hands or feet, and awkward gait (Peterson). The expression of the face varies from apathy to constant laughing, leering, or scowling, the mental characteristics being evident also. There may be deformities of the iris, cornea, or the lids of the eyes, as well as malformation of the nose, ears, and chin. Microcephalus, hydrocephalus, and cretinism are found in some idiots. There are speech defects. Sollier finds two kinds of mutism in idiots, a motor and a sensory aphasia (qv). In the first the idiot cannot talk, though he understands, in the second he understands nothing which is said. Language is developed late in the idiots who talk. As stated, when infants, their notes are not normal, but meaningless, and monotonous cries take the place of the usual crowing of a baby. Speech disturbances are common, as regards both absence of words to express ideas, or imperfections of grammar, and also excessive and infinite loquacity. Reading is impossible in idiots who suffer from defects of the visual centres or the visual apparatus. The writing centre is the latest part of the linguistic cerebral equipment to be developed, together with its association tracts. They learn to reproduce letters, though never to write well, and they exhibit a tendency to write with the left hand and also to write from right to left. They ex-

cute drawing only by copying, without perspective, or produce scrawls of fantastic nature.

From preceding statements it has been gathered that the intelligence of the idiot varies from the normal in different degrees. He has fewer ideas than the imbecile. Imitation does not furnish ideas for him. It simply centres on mechanism, except in the idiots of higher grade, in whom the idea, assimilated by the intelligence, unfortunately is not retained, but lost. Sollier reminds us that memory is hereditary, organic, or acquired. (See MEMORY.) Hereditary memory exists often in idiots. Organic memory, or unconscious memory (as of walking and other associated movements), though sometimes completely absent in idiots, owing to defective nerve centres and lack of attention, is nevertheless better developed than either hereditary or acquired memory. Attention being an absolute requisite for acquired memory, idiots are rarely possessed of this power. Memory fixed by repetition of sensation, without emotional basis, is found in educable idiots, as, e.g., memory of the location of the dining room, of the bed, etc. The phenomenon of specialized memories, such as those for musical airs, or dates, e.g., is inexplicable. Association of ideas, occurring, as it does, by resemblance, contrast, and contiguity, hardly exists in idiots. They experience an association of sensations. Judgment and reason also are very faulty. Volitions do not exist in the lowest order of idiots. Voluntary control of the sphincters occurs in idiots who walk only after they have learned to do so. In higher idiots the will is manifested by more complex movements than actions accomplished for the satisfaction of natural needs and appetites, but even these complex movements may become secondarily automatic. Self-respect, to which one may appeal in an imbecile, is little developed in the idiot.

As to the psychological development of an idiot, points are reached in every case at which education ceases, and further mental progress is impossible. Peterson places the limits as follows in the inferior types: intellectual progress ceases at the age of six or seven, and sentiments and senses continue their development to 18 or 20, while in the superior grades the improvement of senses, sentiments, and intellect may all cease about puberty. Retrogression may occur, following the same law as dementia, to wit, enfeeblement of will, intelligence, sentiments, and sensations in this order. The causes of idiocy are various. Its elements are in many instances hereditary, i.e., a course of conduct in a parent which tends to degeneration, such as excessive alcoholic indulgence of any kind, will tend to induce arrested normal healthy development in offspring. Other causes are injuries received during childbirth, acute disease of the brain or its coverings in early infancy, or even while intrauterine. Injury to the brain may result in idiocy. Chronic disease of the brain coverings, tuberculosis, tumors within the brain, hydrocephalus, are other causes. A peculiar type of idiocy is due to maldevelopment of the thyroid gland. This is called cretinism, or myxedematous idiocy. The attempt to educate idiots commenced in the seventeenth century with an experiment of St. Vincent de Paul at the priory of St. Lazarus. His efforts to teach idiots, though continued for many years, were not successful. In 1799 the celebrated Itard took a wild boy found in the forests of Aveyron

and attempted to teach him, and although the success in this particular case was slight, he believed that he had discovered methods and facts which would be of use in other cases. These he communicated to his pupil, Dr Edouard Seguin, who in 1838 opened a school for idiots in the Hospital for Incurables in Paris. He met with success enough to have the idiots at the Bicêtre sent to the hospital to be instructed, and in the course of three years he received the approval of the French Academy. Dr Seguin adopted a system involving the theory that idioey was prolonged infancy. His practice, founded upon this, was to excite and continue the process of development. Of course a variable success attended the experiment. The art of effecting such development requires much knowledge, tact, and patience. Different kinds of idiots need different stimulants, physical and mental. Pure air, good nutritious food, exercise—in short, any treatment which is calculated to increase the bodily and mental functions—will improve the idiot. Wherever his interest can be awakened there will be a mental stimulus, and as the tendency of development is towards a normal standard, more or less improvement must follow. Seguin was succeeded by the celebrated Bournville at Fondation Vallée, attached to Bicêtre, who carried forward to a new point the systematic education of the idiot and was remarkably successful with imbeciles. Dr Seguin removed to New York City, where he established a school for idiots and feeble-minded children which was very successful. Other similar institutions exist in various parts of the country. Statistics are unreliable, as confusion is apt to be caused by the inclusion of epileptics and insane people with the feeble-minded and imbecile.

Consult Sollier, *Psychologie de l'idiot et de l'imbecile* (Paris, 1891), Preyer, *The Mind of the Child*, translated by H. W. Brown (New York, 1893), Ribot, *The Psychology of Attention* (Chicago, 1894), Peterson, "The Psychology of the Idiot," in *American Journal of Insanity* (Utica, New York, 1896), Barr, *Mental Defectives* (Philadelphia, 1904), Huey, *Backward and Feeble-Minded Children* (Baltimore, 1912), Goddard, *Feeble-Mindedness: Its Causes and Consequences* (New York, 1914), Tredgold, *Mental Deficiency (Amentia)* (ib., 1914). See also MENTAL DEFICIENCY, MENTAL PATHOLOGY.

IDIOCY, IN LAW. A total lack of reasoning powers, or of those intellectual faculties by which man is peculiarly distinguished. Its legal consequences, so far as contract and tort obligations as well as criminal responsibility are concerned, are the same as those of insanity (q.v.). The term is ordinarily limited to those who have had no understanding from birth, although some courts have declared that it is properly applicable to those who have become totally imbecile from sickness or other causes, as well as to congenital idiots. In case of one who has never possessed a glimmer of reason, the law presumes that he will never attain any. Hence, if a freehold tenant of land, the custody of his person and of his lands formerly vested in the lord of whom the fee was held. Because of the abuse of this power, Parliament transferred the wardship of idiots to the King, by Statute of 17 Edw II, c. 9. In this country the care of their persons and property is provided for by statute or safeguarded by constitutional provisions. It was laid down by ancient English

writers upon law that a man who is born blind, deaf, and dumb can have no understanding and hence cannot make a valid contract, gift, or grant. This doctrine had its origin in a misconception of certain texts of the civil law, which declared that one who was deaf or dumb could not be a party to a *stipulatio*, i.e., a contract which was entered into by an oral question and answer, in certain formal words. It is quite clear that a dumb person could not be a party to this formal contract, for he could not ask the question nor speak the response. Deafness also incapacitated one for such a contract, by preventing his hearing the question or the answer. But the civil law never countenanced the presumption that a deaf and dumb person was mentally incapable of entering into a consensual contract. In modern English law the presumption is only *prima facie*, and may be repelled by evidence, that the particular person whose competency is brought into question does possess sufficient intelligence to rank as one of sound mind. Consult the *Commentaries* of Blackstone and Kent, Holmes, *Misunderstandings of the Civil Law*, 6 Am Law Rev 37, and the authorities referred to under MEDICAL JURISPRUDENCE.

IDIOM (Ger *Idiom*, Fr *idiome*, Lat *idioma*, Gk *ἰδιῶμα*, *idiōma*, peculiarity, from *ἰδιόσθαι*, *idiousthai*, to make one's own). A term used to denote a phrase or form of words approved by the general usage of a language and sometimes admitting neither grammatical nor logical analysis. In a broader sense it denotes the genius or peculiar cast of a language, hence it is often applied to a peculiar form or variation of a language, a dialect.

IDIOM, NEUTRAL See UNIVERSAL LANGUAGE.

IDIOPATHY (from Gk *ἰδιοπάθεια*, *idiopatheia*, peculiar feeling, from *ἰδιόπαθος*, *idiopatēs*, affected peculiarly, from *ἴδιος*, *idios*, peculiar + *πάθος*, *pathos*, feeling). A term in pathology, denoting the quality of being idiopathic. An idiopathic disease is a primary condition, not dependent on another disease or injury. Idiopathic epilepsy, e.g., is so called when it is not secondary to or dependent upon any obvious cause, such as injury to the head or reflex influences. (See EPILEPSY.) In the sense of idiosyncrasy (q.v.) or peculiar susceptibility, the word is obsolete.

IDIOSYNCRASY (Gk *ἰδιοσυγκρασία*, *idiosynkrasia*, peculiar temperament, from *ἴδιος*, *idios*, peculiar + *σύνκρασις*, *synkhrasis*, mixture, from *συνκεραινύναι*, *synkerannynai*, to mix together, from *σύν*, *syn*, together + *κεραινύναι*, *kerannynai*, to mix, from *κρᾶσις*, *khrasis*, mixture). An individual trait or constitutional peculiarity. Thus, there are persons who have a great dislike to particular kinds of food, smells, sounds, etc., which to most persons are agreeable, and, on the other hand, a desire is sometimes manifested for things generally disliked. In particular individuals an eruption of the skin will be caused by eating strawberries, or fainting by the smell of a rose, when the person is unaware of the cause. Idiosyncrasies also occur in consequence of which certain medicines become inoperative, or certain poisons harmless. On the other hand, many individuals exhibit an idiosyncrasy to certain drugs, so that minute doses of them will produce profound or even alarming effects. Idiosyncrasies are either permanent or temporary, sometimes arising from mere morbid conditions and disappearing along

with them. The term is also employed to denote *mental* as well as *physical* peculiarities, which are often signs of insanity, such as baseless antipathies to certain persons, bizarre arrangement of articles in one's room, permanent dread of passing certain objects, etc.

IDIOT. See IDIOCY, MENTAL DEFICIENCY.

IDITAROD, e-dé'ta-rót'. An Alaskan mining town, the centre of the gold-mining industries of the upper Innoko and Iditarod valleys and of adjacent regions (Map Alaska, G 4). It has a wireless station and is connected by a winter trail of 512 miles with Seward, via Susitna (pop., 233) and Knik (pop., 118).

IDLEER, THE. The title of a series of papers by Dr. Johnson, published in Payne's *Universal Chronicle* (1758-60).

IDOCRASE, i'dô-krās. See VESUVIANITE.

IDOL (OF *idole*, Lat. *idolum*, from Gk. εἶδω-λον, *eiddôlon*, image, from εἰδέναι, *eidenai*, Skt. *vid*, to know, Lat. *videre*, to see). An image intended to represent a deity and to be adored as such. The act of such adoration is idolatry. Through theological usage the term "idolatry" has come to mean in a general sense any worship or obeisance paid to any other than the Supreme Being as conceived by Judaism, Christianity, or Islam. Confining ourselves to the more restricted usage, the worship of idols appears to be a phase of religious evolution that is natural to man at a certain stage of culture. It arises from the desire to furnish some tangible evidence of the presence of the powers upon whom man feels himself to be dependent. In this sense idolatry is to be distinguished from the attribution of divine force to a sacred stone, river, or other object. The sanctity is inherent, for one reason or the other, in such objects themselves, whereas the sanctity of an idol is due to its being a symbol. It becomes evident, therefore, that while the direct worship of objects is a link in leading to a symbolical image worship, the latter belongs to a phase of religious thought transcending the more primitive manifestations of the religious instinct. This thesis finds an illustration in the religious history of the Semites as well as in that of the Greeks and Romans. The localization of nature deities, such as the sun, moon, and certain planets, led in the case of the Babylonians and Egyptians to representation of the gods of a more or less fanciful character, and the development of the art instinct acts as a powerful factor in promoting and maintaining the worship of these gods under the form of images of men or animals, or of a combination of the two. The influence exerted by Babylonian and Egyptian culture led the nations of Palestine—notably the Phœnicians—to replace poles and stones by symbolical representations of the gods, and the Hebrews likewise after they had advanced to the agricultural stage fell a prey to these same influences until, through the reaction brought about by the teachings of the prophets, an emphatic protest against all manner of idolatry is embodied in the religious system and cult of post-exilic Judaism. The rise of Christianity helped to spread the doctrine further, though the Christian veneration of sacred images (see IMAGE WORSHIP) was by some confounded with idolatry. Islam struck at the root of the matter by forbidding the making of any representation of any living thing, whether intended to be worshipped or not (Cf. Ex. xx 4). To give life was felt to be the exclusive prerogative of God,

and to attempt to reproduce even the external form of a living thing was regarded as impiety. As a consequence, wherever Islam secured a foothold idolatry was doomed. Zoroastrianism at least did not encourage idolatry, but it is noticeable that in the extreme East—India, China, and Japan—idolatry was not only reconciled with the remarkable development of religious thought that took place in those regions, but its hold seemed to grow stronger with each new phase in this evolution.

IDOLATRY. See IDOL.

IDOMENEUS, i-dôm'é-nūs (Lat. from Gk. Ἰδομενεύς). The grandson of Minos and son of Deucalion of Cete. As ruler of Cnosus and Cete, he led 80 ships to Troy. In the *Iliad* he is described as one of the mightiest of the heroes, and in the battle at the ships he plays a leading part. The early history makes him return to his home in safety and receive there in due time an honorable burial. In later writers he was represented as vowing during a storm to sacrifice to Poseidon the first living thing that should meet him on a safe return to Cete. The victim was his son. When presently a plague broke out in the island, his subjects drove him forth. He wandered to Calabria in Italy, where he built a temple to Athena, and later from Italy to Asia Minor, where he established a shrine of Apollo near Colophon. Here he died and was buried.

IDRAC, é'drak', ANTOINE (1849-85). A French sculptor, born at Toulouse. He studied under Guillaume and Falguère at the Beaux-Arts. He first exhibited at the Salon in 1877 and won a first-class medal in 1879. The Luxembourg has his "Mercury Discovering the Caduceus" and "Salambo." The latter reveals remarkable ability in representing the suppleness of the nude, the mastery of which was the chief characteristic of his art. "Salambo" won him the cross of the Legion of Honor.

IDRIA, é'dre-a. An important mining town in the Austrian Crownland of Carniola, situated in a deep caldron-shaped valley on the Idria, 25 miles west of Laibach (Map Austria-Hungary, D 3). Idria is famous for its quicksilver mines, ranking only second to the Almaden mines of Spain. They were discovered in 1497 and have been operated by the state since 1580, employing altogether about 1250 persons and yielding over 500 tons of quicksilver annually. It has also a trade school for bobbin workers, a bobbin factory, and electric works. Pop. (district), 1910, 16,376.

IDRISI, id-ré'sé. See ENRISI.

IDRISITES, id'ri-sits. A dynasty of Arab rulers in the northwest of Africa. The founder of the line was Idris of the race of Ali, who in 786 became ruler over several native Berber tribes. His capital was Walili, on the site of the Roman city Volubilis. His son Idris II founded Fez in 808 and greatly increased his possessions by conquest, but on his death the kingdom was divided among his sons, and, thus weakened, it fell an easy prey to the power of the Fatimites, who took possession of Fez in 921. One of the Idrisites, Al Hasan, maintained himself in a part of Fez until 926. Consult Mackenzie, *The Khalifate of the West* (London, 1911).

ID'UMÆ'A. See EDOM.

IDUN, é'doon (Icel. *Þunn*, perhaps from *ǣ*, energy, cf. Eng. *eddy*, or from prefix *ǣ*, meaning 'again'). The name of a goddess of Scandinavian mythology. She was the daughter of the

dwarf Ivald, but, being received among the Æsir, she became the wife of Bragi. Idun possessed a box of apples, by the use of which the gods preserved their perpetual youth. She was carried off by the giant Thiazi, with the assistance of Loki. But the gods, beginning to grow old and gray without their apples, sent Loki after her, and, changing himself into a falcon and Idun into a nut, he returned with her to Asgard. In this myth Idun represents spring, and Thiazi winter. According to Sophus Bugge, the main story may be closely connected with the Greek myth of the golden apples of the Hesperides in an Irish version. The introduction of edible apples at a time when this fruit was unknown in the North seems to imply a foreign source.

ID'YA. A poetical name of Britannia.

IDYL, or **IDYLL** (from Fr *idylle*, Lat *idyllium*, from Gk *εἰδύλλιον*, *eidyllion*, short poem, from *eidos*, *eidos*, form, scene). A term generally used to designate a species of poems of moderate length representing scenes of pastoral or out-of-door life. It is, however, an error to suppose that the idyl is exclusively pastoral, certainly there is no warrant for such a notion in either ancient or modern usage. Of the 31 idyls attributed to Theocritus (q.v.), only 10 are bucolic.

IDYLLS OF THE KING. Twelve poems by Tennyson, published between 1842 and 1885, based on the Arthurian romances. The titles are "The Coming of Arthur," "Gareth and Lynette," "The Marriage of Geraint," "Geraint and Enid," "Balin and Balan," "Merlin and Vivien," "Lancelot and Elaine," "The Holy Grail," "Pelleas and Ettarre," "The Last Tournament," "Guinevere," "The Passing of Arthur."

IDZU, *ē'dzō*. One of the 15 provinces of Japan which make up the Tōkaidō, or East Sea Circuit, and through which the highway called the Tōkaidō runs. It is a mountainous peninsula, with numerous bays and promontories, 32 miles long and 16 wide, lying between the bays of Sagami on the east and Suruga on the west. Geologically and topographically it forms part of the volcanic range of mountains with which the name Hakone is associated. Its most important river is the Kanōgawa, which flows north into Suruga Bay, and its highest peak is Amagisan, with a height of about 4800 feet. Its chief towns are Mishima, on the Tōkaidō, and the small but beautiful port of Shimoda, on the southeast coast. The rearing of silkworms and the reeling of silk form the principal industry of the peninsula. It abounds in hot springs and watering places, the chief of which is Atami, about 45 miles from Yokohama. To Idzu-Shichito belong, both geologically and politically, the "Seven Volcanic Islands," of which Oshima, or Vries Island, 38 miles from the mainland, is the chief, and farther south Hachijō-shima, long used as a place of banishment. Consult Rein, *Japan* (London, 1884), and Satow and Hawes, *Handbook for Travellers in Central and Northern Japan* (Yokohama, 1881).

IE'ENE, *i-ēr'nē*. An ancient Greek name for Ireland.

IE'SI. See **JESI**.

IF, *ēf*. A rocky island about 2 miles west of Marseilles, with a castle, the Château d'If, built in 1529, and later used as a state prison. In it Mirabeau, Philippe Egalité, and others were confined. The castle is most widely known through Dumas's *Count of Monte Cristo*.

IFFLAND, *ēf'lant*, AUGUST WILHELM (1759-

1814). A German actor and dramatist. He was born at Hanover and was intended for the Church, but before he was 19 the stage had become his choice. He went to Gotha, where he studied under Gottei, Beck, Beil, and Ekhof, and thence in 1779 to Mannheim, where he first became famous by his rôle of Franz Moor in Schiller's *Rauber*. Differences with his manager induced Iffland in 1796 to accept the post of director in the Berlin National Theatre. Fifteen years afterward he was made superintendent of all the royal theatres, and under his management the Berlin stage reached its highest point. But he was not merely an able manager. As an actor, he showed himself artistic, painstaking, and minute, strong in comedy of everyday life. Voice and figure unfitted him for tragedy. For the stage he translated and wrote himself, for the most part, plays of over-great sentiment and too strongly urged didactic purpose. Iffland was really no poet, but he so well knew how to depict on the stage the everyday troubles of the ordinary mortal that his plays were very popular. In them, however, he displayed some literary talent and great practical knowledge of the stage. *Verbrecher aus Ehrsucht*, *Die Jäger*, *Dienstpflicht*, *Der Spieler*, and *Die Mündel* kept the stage for a century. Iffland's dramatic criticism is to be found in his *Almanach für Theater und Theaterfreunde* (1806-11) and *Theorie der Schauspielkunst* (1815). His complete works appeared in 24 volumes (1843 et seq.). Consult Duncker, *Iffland in seinen Schriften* (Berlin, 1859), the autobiography, *Meine theatralische Laufbahn*, edited by Holstein (Heilbronn, 1886), Genée, *Ifflands Berliner Theaterleitung* (Berlin, 1896), A. O. Stuchler, *Das Ifflandsche Ruhstück* (Hamburg, 1898), Kail Lampe, *Studien über Iffland als Dramatiker* (Celle, 1899).

IFNI, *ēf'nē*. A seaport town of Africa, situated on the west coast of Morocco, opposite the Canary Islands (Map Africa, C 2). It was ceded by Morocco to Spain in 1883. Pop., about 6000.

IFUGAO, *i'fōō-gou'*. A Malay tribe which occupies the subprovince of Ifugao in northern Luzon. They are a strong, well-built people, of medium height, with dark brown skins and straight hair. The ordinary clothing of both sexes is very scanty, but this lack is in part made up for by elaborate tattooing and extensive use of ear, neck, arm, and leg ornaments. The Ifugao live in settlements the buildings of which are raised several feet above the ground and are carefully constructed of boards. These villages are always near the rice fields in order that the people may keep watch on their crops. The rugged nature of the country has compelled the people to cultivate the mountain sides, and there they have developed a system of terraced fields which excels that of any other primitive tribe. The stone retaining walls are often 40 feet high, and so steep are the mountain sides that the level plots gained by building such walls and filling in behind them are often not more than 20 feet wide. Water is brought for long distances by means of flumes and ditches and then is skillfully led from plot to plot. In addition to being wonderful agriculturists, the Ifugao are expert workers in iron and steel and are also skillful wood carvers. When not held in check, the men are still inveterate head hunters, and it is no uncommon thing to find the skulls of enemies placed on a shelf beside

the entrance to a dwelling. The people known as Quangan belong to this tribe. See PHILIPPINE ISLANDS.

IGBARA, ēg'ba-ra, or **IGBIRA**, ēg'bī-ra. A negro people of the Sudan living at Nupé on the right bank of the Niger and southward to Yoruba. They are said to be industrious and commercial. Their language belongs to the same linguistic group with Nupé, Ewe, and Tshi. Half a century ago the Kingdom of Nupe was subdued by the Hamitic Fulahs, and the Igaras, together with other kindred tribes, were brought under Moslem influence, though many are still pagan. The ruins of Fende, or Panda, the capital of this once powerful dominion, are still to be seen. They are governed by a Fulah Emir, but are within the British Protectorate. See FULAH.

IGERNA, i-gē'na, **IGERNE**, i-gēr'n', **IGRAINE**, i-grān', or **YGNERNE**, ig-nēr'n'. In the Arthurian romance, the wife of Gollois, Duke of Cornwall. She was loved by Uther, King of Britain, and by him became the mother of Arthur.

IGLAU, ē'glou. An ancient town of the Austrian Crownland of Moravia, situated on the Iglawa and on the Bohemian frontier, 56 miles northwest of Brunn (Map: Austria-Hungary, D 2). It has a fine market place, a number of interesting churches (including St John's, dating from the eighth century), a Rathaus, barracks (formerly a Dominican monastery), and a cloth hall. In the Middle Ages Iglau was an important silver-mining centre, but since the Thirty Years' War mining has been practically extinct, and the manufacturing of cloth and woolen goods is now the foremost industry. There are numerous weaving, spinning, and dyeing establishments, and a state cigar factory employing over 2500 hands, also manufactures of plush, lace, shoes, leather, ether, furniture, pottery, and sugar. There is also a considerable trade in agricultural products, cloths, and lumber. Pop (district), 1900, 36,930, 1910, 38,369, chiefly German Catholics and including over 4000 Czechs. Iglau is a town of great antiquity, its silver mines having been worked as early as the eighth century. By the Treaty of Iglau, in 1436, a settlement was effected between the Hussites and Sigismund, who was acknowledged King of Bohemia. The town suffered heavily from a fire in 1523 and was twice captured by the Swedes during the Thirty Years' War.

IGLESIAS, ē-gla'se-as, **JOSÉ MARÍA** (1823-91). A Mexican statesman and author. He was born in the city of Mexico, studied law in the university there, and later became professor of jurisprudence in that institution. He early entered politics and speedily attracted attention by his natural ability. Political preferment rewarded his loyalty to the government, and in 1857 he became Secretary of Justice and a little later Secretary of the Treasury. In 1863 he was again Secretary of Justice, and from 1864 to 1867 he held the two portfolios of Justice and the Treasury. In 1868 he was a member of the General Congress, and the same year was appointed Secretary of the Interior by Juárez, to whose fluctuating fortunes he had clung with unswerving fidelity. In 1873 he became president of the Supreme Court and by virtue of that office assumed the presidency of the Republic when Lerdo de Tejada was overthrown in 1876, but was soon compelled to give up the position to Díaz. After 1878 he applied

himself to journalism and published several works on Mexican history, among them *Revistas historicas sobre la intervención francesa en México* (Mexico, 1867-69).

IGLESIAS, MIGUEL (1822-1901). A Peruvian soldier, born in Cajamarca. He came into prominence just before the Chilean-Peruvian War, serving as Minister of War in 1880. In 1881 he did valiant service in the defense of Lima against the Chileans and was captured, but afterward escaped. He held the view that it was necessary to accede to Chile's demand for alienation of territory in order to secure the withdrawal of the invading army. At the suggestion of Chile in 1883 he assumed the presidency, formed a cabinet, and entered into the Treaty of Ancón on October 20. (See PERU.) The many Peruvians who did not approve the treaty opposed General Iglesias under the leadership of General Cáceres. The opposition secured such success that, in 1885, an agreement was entered into, by which both Iglesias and Cáceres resigned from power and a council of ministers was formed to govern till an election was held. Upon the election of Cáceres to the presidency in 1886 Iglesias went into exile.

IGLESIAS, PABLO (1850-). A Spanish politician and Socialist leader, born in the Province of Coruña. He learned the painter's trade and in 1868 became affiliated with the Internationale des Travailleurs. In 1871 he was a member of the federal council of the International of Spain and worked on the Socialist paper, *La Emancipación*. He was one of the organizers of the Partido Socialista Obrero in 1878 and later served as president of the Asociación del Arte de Imprimir and of the Federación Tipográfica. After 1885, when he became editor of *El Socialista*, the official organ of the Socialist party, he was most active as an agitator. In 1910 he was elected one of the representatives of Madrid to the Cortes, and in 1913 was president of the Unión General de Trabajadores (Labor Union).

IGLESIAS DE LA CASA, dā la ka'sa, **JOSÉ** (1748-91). A Spanish poet, born at Salamanca. His earliest writings were satires in the form of epigrams and *letrillas* directed against contemporary society. After entering the Church he wrote works of a graver nature, and later his verses were merely rhymed theological discussions. His style has much clearness and animation, but lacks originality. The first edition of his works is that of Salamanca (1798). The idyls and romances included in this edition are not so well known as his poetry and are of less value. His name is included in the *Catálogo de autoridades de la lengua*, published by the Academia Española. Consult *Biblioteca de autores españoles*, vol. LXI (Madrid, 1869), and Iglesias, "Poesías inéditas," in *Revue hispanique*, vol. II (Paris, 1895).

IGLOO, ig'loo. See SEWARD PENINSULA.

IGLOO, or **IGLU**. See ESKIMO.

IGNACIO, ēg-na'thē-ō, **JOSÉ DE JESU MARÍA** (1721-80). A German Jesuit, whose secular name was Herman Loessing. He was born in Paderborn and began his clerical career as professor of rhetoric and philosophy in the College of Old Mexico. While there he became interested in the antiquities of the country and spent about 10 years in collecting them. Returning home with his spoils, he became librarian to the Archbishop of Cologne (1768) and published *De Arte Hieroglyphum Mearcanorum* (1774), His-

toria Novæ Hispaniæ (1777), *Reisen in Neu-Spanien* (1778), *Historia Regni Aztecorum* (1780), and *Cosmographia* (1780). He became blind before his death, and after it his notes were incorporated into two works by Chastelard.

IGNATIEFF, ig-na'tyéf, NIKOLAI PAVLOVITCH, COUNT (1832-1908). A Russian general and diplomat, born in St Petersburg, Jan 29, 1832. He was the son of a favorite officer of the Emperor Nicholas and was commissioned in the Guards in 1849, he served in the Crimean War, and was made a colonel in 1856 and a major general in 1858. In the latter year he was made diplomatic attaché to General Muravieff, Governor of east Siberia, and in this capacity negotiated with China the Treaty of Aigun (May 28, 1858), by which Russia came into possession of the region of the Amur. He was subsequently sent on a special mission to Khiva and Bokhara, and as Plenipotentiary to Peking in 1860. He was made adjutant general of the Czar in 1863 and was placed at the head of the Asiatic department of the Ministry of Foreign Affairs. In the following year he was sent to Constantinople to represent the Czar at the court of the Sultan, and he remained in this important post until the outbreak of the Russo-Turkish War in 1877, which he did much to bring about. He was an active agent in the events of this exciting and critical period, encouraging the restlessness of the Christian peoples of the Balkans, while endeavoring to maintain the Russian influence over the Sultan. In the pursuit of his ends Ignatieff did not hesitate to resort to duplicity and the basest kind of intrigue and succeeded in gaining the sobriquet of *Liar Pasha*. Through such means he was quite successful in maintaining the Russian influence during the life of Abdul Aziz, but after the latter's violent death and the deposition of Amurath V (1876), the anti-Russian influence became predominant with Abdul Hamid, and events moved rapidly towards war. After the conference at Constantinople during the winter of 1876-77, Ignatieff hastened to Berlin, Vienna, and London on diplomatic business. At the close of the war he participated in the negotiations of Adrianople and was mainly responsible for the Treaty of San Stefano. On account of disagreements with Gortchakoff he retired from office, but on the accession of Alexander III (1881) he was recalled and made Minister of the Imperial Domains and then of the Interior. While holding this office he attained prominence as a persecutor of the Jews. His administrative inability led to his dismissal, June 21, 1882.—His brother ALEXEI PAVLOVITCH (1842-1906) rose to be lieutenant general, and was Governor-General of Kiev in 1889-97 and of Odessa for a short time in 1905. He was a noted reactionary and was assassinated in December, 1906.

IGNATIUS, ig-na'shi-ús, SAINT (c 790-878). A patriarch of Constantinople, youngest son of the Emperor Michael I. In 813 the Armenian usurper Leo V forced him to enter a cloister. From the position of abbot the Empress Theodora raised him to that of Patriarch of Constantinople (847). He had no sympathy with the iconoclasts and so was in favor with the Empress. On the other hand, he excommunicated her brother Bardas, who made him one of his first victims when he took the reins of government for the young Michael III (857). Ignatius refused to abdicate until forced to do so in 866. He was reinstated on the accession of the

Emperor Basilus in 867. He is still a favorite saint in the Greek church and his day is celebrated on the 23d of October.

IGNATIUS OF ANTIOCH, SAINT. Bishop of Antioch in the reign of Trajan, and author of seven Greek letters which are included among the works of the Apostolic Fathers (qv). Little is known of Ignatius' life. He was born probably not far from the middle of the first century. Syria appears to have been his home. Tradition says that he was a disciple of the Apostle John, which is not impossible. Much less likely is the tradition which makes him the child whom Jesus took in His arms and blessed. There is no reasonable ground for doubting that Ignatius was Bishop of Antioch, but we do not know how long he held that office. The statement of Origen and Eusebius that he was the second Bishop may be accepted. This leaves Peter out of account and makes Ignatius the successor of Evodius. Respecting the close of his life we have more definite information. He was condemned to be killed by wild beasts in the arena and for that purpose was taken to Rome, under guard of 10 Roman soldiers. They passed through Asia Minor, stopping here and there and being received with Christian hospitality by the churches along their route. At Smyrna Ignatius wrote letters to the churches of Ephesus, Magnesia, Tralles, and Rome. Farther on, at Troas, he wrote to the Philadelphians, the Smyrniacans, and to Polycarp, Bishop of Smyrna. He then was led to Rome, where he suffered martyrdom, probably at some time between 107 and 117 A.D., though Harnack would extend the time to 125 A.D. It was believed, at a considerably later time, that his remains were carried to Antioch for burial.

The extant *Martyr Acts* of Ignatius are not authentic. Long and bitter controversy has raged over the epistles which bear his name. They are extant in several different versions, especially three: (1) *the longer Greek*, containing 13 epistles, (2) *the shorter Greek*, containing seven epistles, (3) *the Syriac*, containing only three epistles. The critical question is, Which form, if any, is the genuine one? Opinions have varied widely. It has been held (a) that all the recensions are spurious, (b) that the shorter Greek form alone is genuine, (c) that the Syriac alone is genuine, (d) that, of the shorter Greek form, all the epistles except Romans are genuine, and (e) that Romans only is a genuine epistle. The best modern criticism holds to the authenticity of the seven epistles in the shorter Greek form. There is almost contemporary witness borne to the Ignatian letters in the Epistle of Polycarp to the Philippians, where the usually accepted letters are mentioned. See POLYCARP.

Accepting these seven as genuine letters of Ignatius, we learn to know their author as a fervent, enthusiastic Christian bishop, of intense zeal for martyrdom. He constantly insists on maintaining allegiance and obedience to the bishop, who is the centre of unity. It is evident that the monarchical episcopate, i.e., the system of having one bishop over each church, had already been developed in Syria and other portions of the East, whatever may have been the case elsewhere. No early Christian writer is so important for the history of the hierarchy as Ignatius. The heresy against which Ignatius warns is chiefly docetism, for he declares that Christ suffered in fact, not merely in appearance. He also warns against Judaizing heresies.

From the doctrinal point of view Ignatius is highly important, standing as he does in the line of catholic development which passes from Paul and John, through Ignatius and Irenæus, to the full-grown Nicene theology. It is in his letter to the Christians of Smyrna that we meet for the first time with the phrase "the Catholic Church," which here means "the universal Church." He also uses the term "eucharist" for the Lord's Supper. But, above all else, his epistles bear witness to the earnest, devoted spirit of early second-century Christianity and to the vitality of faith in the age succeeding that of the Apostles.

For the best edition of Ignatius, consult Lightfoot, *The Apostolic Fathers Part II, S. Ignatius and S. Polycarp* (London, 1889), with English translation. Text and translation are also found in the small edition of Lightfoot, *Apostolic Fathers* (ib., 1893), English translation alone in the *Ante-Nicene Fathers*, edited by Roberts and Donaldson, vol. 1 (Buffalo, 1886). In general, consult Smith and Wace, *Dictionary of Christian Biography* (4 vols, Boston, 1877-87). Cruttwell, *Literary History of Early Christianity* (London, 1893), Von der Goltz, *Ignatius von Antiochien* (Leipzig, 1894), Krüger, *Early Christian Literature* (New York, 1897), Harnack, *Chronologie der altchristlichen Literatur* (Leipzig, 1897). Catholic presentations of his teaching are in Newman, *Historical Sketches*, vol. 1 (London, 1890), and Gasquet, *Studies* (ib., 1904).

IGNATIUS OF LOYOLA, lo-yō'la, SAINT (1491 or 1495-1556). The founder of the Jesuits. Inigo Lopez de Recalde was the youngest of 13 children, of a noble family. He is usually said to have been born on Christmas night, 1491, but the Bollandists and Polanco are authority for the change to 1495. He was born in the ancestral castle of Loyola, near Azpeitia, in the Basque Provinces, not far from the French frontier. At 14, after a scanty education, he became a page at the court of Ferdinand the Catholic. Court life grew distasteful after some years, however, and he became a soldier under his relative, the Duke of Najera, in 1517. He fought bravely against the Navarrese, the Moors, the Portuguese, and the French. He had reached the rank of captain when, while directing the defense of Pamplona against the French in the war between Francis I and Charles V, he was wounded severely, May 20, 1521. He was taken prisoner and conveyed to the castle of Loyola. As a result of the wound, one leg was badly deformed. This would have been very unsightly in the fashionable hose of the day, and he bade the surgeon reduce the deformity at any cost. The leg was rebroken, and he bore the operation and consequent suffering without complaint. His convalescence was prolonged, and time hung heavily on his hands. He asked for some romances of knight-errantry then popular, but there were none in the castle. Instead they brought him a translation of Ludolf of Saxony's life of Christ, and some lives of the saints. Ignatius' life as a soldier had been the careless and gay one of an officer. For want of anything better to do, however, he read and reread these pious books. The spiritual achievements of St. Francis and St. Dominic came to replace the deeds of his knightly heroes in his imagination. He began to see visions, and his family grew alarmed lest he should rashly surrender his career for a life of religion. As soon

as he was able he went to the shrine of the Virgin at Montserrat, where, after a confession of his whole life on the vigil of the Annunciation, March 24, 1522, he hung up his arms as a votive offering and a symbol of his renunciation of his military career and of his entire devotion henceforth to the spiritual warfare, gave away his rich clothing, and went to the neighboring town of Manresa, where he served the sick and poor in the hospital. He lived in a cave, and his austerity finally impaired his health, though it was at this time that his *Spiritual Exercises*, from which he drew great spiritual strength, took form in his mind. Thus began a life of extreme asceticism, which, though it often endangered his health, yielded to his mystical mind ecstatic experiences. After this he went on a pilgrimage to the Holy Land and would have stayed at Jerusalem to spread the gospel among the infidels, but was forbidden by the local authorities. He returned to Barcelona in 1524. Realizing now that to do good he must have more knowledge, he began, at the age of 33, the rudiments of grammar in a public school beside boys. After two years he went to the new University of Alcalá and later to Salamanca. Because of public religious teaching with what was thought insufficient education, he incurred the censure of ecclesiastical authorities at both places. In 1528 he repaired to Paris to continue his studies. He was robbed by a companion and had to lodge in a hospital, where he did menial work for his support while attending the university. During his summer vacations he visited Spanish merchants in Antwerp, Bruges, and London so as to obtain money to continue his studies. During his student years he had no resources but the charity of the faithful. His earlier companions did not all remain his followers, but at Paris he formed a pious confraternity, out of which developed later the Society of Jesus. (See JESUITS.) Most of these were men of unusual ability. One became later the great Apostle of the Indies, Francis Xavier, and three, Lainez, Salmeron, and Lejay, became the leading theological advisers to the Council of Trent. One of the others, Faber, received the honors of beatification from the Church. In the crypt of the church of the Martyrs, on Montmartre, on the Feast of the Assumption, Aug. 15, 1534, the little band took their vows. At first their intention was to evangelize Palestine. They made their way to Venice for this purpose, but the war between the Christians and the Turks closed the way to the Holy Land, so they resolved to offer themselves to the Pope for any service he might assign. Paul III received them with great kindness. The pulpits of churches in various Italian towns were assigned to them, and their burning discourses and saintly lives soon attracted attention. No other of them was so effective as Ignatius himself, who spoke as the plain, blunt, but intensely earnest soldier. In 1539 Ignatius asked for papal approbation of his order. In spite of opposition to the erection of another religious order in the Church, the Pope read the draft of the Constitutions, and said, "The finger of God is here." While occupied with his constantly growing society, of which he was the superior, Ignatius found much to do besides its direction and the writings of the Constitutions. Though a Spaniard, he devoted himself to the care of the Jewish converts and secured the correction of many abuses in the treatment of those who wished to remain orthodox Jews. He

IGNATIUS LOYOLA
AFTER A PAINTING BY RUBENS

founded a house for fallen women and was not ashamed to be seen conducting them to it through the streets. He tried to prevent the occasions of their fall by providing a home for friendless girls. He established orphan asylums for boys and girls. The influence he acquired can be understood from the fact that he was able to end a dispute between the Pope and John III of Portugal that threatened serious harm to religion at the moment, and another between the citizens of Tivoli and their ruler, Margaret of Austria.

His writings consist only of the Constitutions and rules of the Society of Jesus, his Letters, and the *Exercitia Spiritualia*. This last little book of scarcely 100 duodecimo pages has proved one of the most influential works ever written. In 1552 he began to teach his spiritual exercises to his companions, and the earliest extant text of their publication dates from 1541. From the very beginning this work formed the basis of the spiritual training of the Jesuits themselves and the mold in which their retreats and missions to the people were cast. It has come to be the acknowledged model after which the missions and retreats given by most of the other religious orders of the Roman Catholic church are conducted. Three things are treated of particularly in the book: the service of Jesus Christ, placed above all that the kings of the earth can offer, the discernment of spirits, and finally the choice of a state of life. It was this book that accomplished the reforms the Jesuits effected. The Constitutions of the Jesuits are entirely the expressions of Ignatius' ideas. They have been but slightly modified, never in any essential, by successive General Congregations. It is often said that Ignatius founded the Jesuits to counteract the effects of the German Reformation, but there is good authority for believing that when Ignatius conceived the idea of his order he had not even heard the name of Luther. Even more than a decade later, he seems to have paid little heed to the religious movements in Europe, especially in Germany. One year before his death, in 1555, the society comprised eight provinces, divided as follows: Italy, two; Spain, three; Portugal, one; Brazil, one; India and Japan, one. In Germany there were but two residences, Cologne and Vienna. He died in Rome, July 31, 1556. He was beatified in 1609 and canonized in 1622.

Bibliography. Ribadeneira, *Vita Ignatii Loyolæ Soc Jesu Fundatoris* (Naples, 1572, best recent ed., Barcelona, 1885), translated into most modern languages. For Ignatius' life as General of the Jesuits, his *Cartas de San Ignacio de Loyola* (Madrid, 1874) are the authoritative sources of information. Ignatius dictated some autobiographical notes called the *Acta*, which must form the basis of an appreciation of the man himself. There are several English editions of this *Autobiography of St Ignatius* (ed. O'Connor, S.J., New York, 1900), and Rix, *The Testament of Ignatius Loyola* (St. Louis, 1900). Of recent lives the most authoritative are Clair, *La vie de Saint Ignace de Loyola* (Paris, 1891), in English, Stewart Rose (the Duchess of Buccleuch), *St Ignatius of Loyola and the Early Jesuits* (New York, 1891), F. Thompson, *Life of St Ignatius* (ib., 1910), an excellent study of Ignatius the man, Joly, *Saint Ignatius of Loyola* (ib., 1899). In the *Monumenta Historica Societatis Jesu* (Madrid, 1894) there is a hitherto unissued life of Ignatius by Polanco, who was a close personal friend.

Consult, also, Hughes, *Loyola and the Educational System of the Jesuits*, 'Great Educational Series' (New York, 1892), and J. Stephen, *Essays in Ecclesiastical Biography* (2 vols., ib., 1907).

IGNATIUS' BEAN, SAINT See SAINT IGNATIUS' BEAN

IGNEOUS ROCKS (Lat. *igneus*, fiery, from *ignis*, Skt. *agni*, fire) Rocks produced as the result of solidification from a molten condition. They are also often called eruptive rocks, although the word 'eruptive' belongs more properly to that class of igneous rocks that have cooled at the surface. The igneous rocks include lavas which have been poured out upon the earth's surface, the fillings of the fissures, pipes, and other passages in the earth's crust through which molten material was conducted during its rise to or towards the surface, and the larger masses which consolidated at great depths and are commonly known as plutonic rocks. The agents of decomposition and disintegration of rock material and those of transportation and degradation necessarily expose to view these several types of igneous rocks, each of which possesses certain general and distinguishing characteristics. The most noteworthy general characteristic of the igneous rocks, when unmetamorphosed, is a massive structure without lamination or bedding, such as is characteristic of the sedimentary or clastic rocks on the one hand, or schistose structure, such as is developed in the metamorphic rocks. Inasmuch, however, as it has been shown that many *metamorphic rocks* (qv) have been formed from igneous rocks, it is clear that no sharp line can be drawn to separate these classes on the basis of structure, although in the main the above distinction applies. See PLUTONIC ROCKS.

Prominent among the textures characteristic of the igneous rocks are the granitic, the porphyritic, and the vitreous, or glassy. The granitic texture is crystalline throughout and consists of an interlocking mosaic of the different mineral constituents, the nearly uniform size of the grains indicating that the process of consolidation was essentially an uninterrupted one, and that practically the same conditions obtained during all stages of the process. In this mosaic the mineral constituents which first separated from the magma have more or less perfect crystal outlines, whereas those of later separation have irregular boundaries because sufficient space was not available in which to build out their crystal faces. The porphyritic texture, which is the next most common among the igneous rocks, has crystals of one or more of the mineral constituents of the rock embedded in a base or ground mass of smaller crystals or of rock glass. The crystals embedded in the ground mass are known as porphyritic crystals, or phenocrysts (qv). It is generally supposed that the phenocrysts were crystallized out of the magma in a stage of the process of consolidation earlier than that which produced the ground mass of the rock, and as most igneous rocks of porphyritic texture have been formed either at the surface of the earth or at quite moderate depths below it, it is supposed that the phenocrysts were formed at considerable depths before the magma rose to or near the surface. In the lavas that flow from Vesuvius or from most other volcanoes, the phenocrysts may be picked out of the still molten lava as it flows from the volcano. The vit-

reous, or glassy, texture is one of comparatively infrequent occurrence, but is represented by obsidian (qv) and pitchstone. It is now generally recognized that many igneous rocks which have an entirely crystalline texture were once largely composed of rock glass, which has devitrified through processes of chemical alteration and crystallization.

In addition to the above textures characteristic of igneous rocks and dependent upon the state of crystallization of the rock substance, there are other features which call for notice. One of the most common observed in lava (qv) is a peculiar crumpled lamination of the rock caused by the arrangement of mineral constituents of unequal dimensions with their longer axes parallel to the crumpled lines. This fluxion structure is conditioned by the flow of the lava, the crumpled lines indicating the direction of flow. Other structures, as the amygdaloidal, scoriaceous, and pumiceous, which indicate different grades of cellular or porous texture, are conditioned by the steam once held in the lava and the opportunities for expansion and escape of this steam as the lava approached the surface of the earth.

In chemical composition the igneous rocks show wide variation, though limits are set by the laws of formation of magmas. No such limits are set for the clastic rocks. By processes of alteration the igneous rocks change into the metamorphic rocks (as do also the clastic rocks), so that no sharp line can be drawn to separate these great divisions.

Great difficulties arise in the systematic classification of igneous rocks by reason of the many ways in which it is possible to describe them, and the varying importance which is attached to each method, hence great difference of opinion exists among petrographers as to the best scheme to be adopted. On the continent of Europe, and especially in Germany, the manner of occurrence of a rock, whether as a boss or batholith (qv), as a dike (qv), or as a sheet or flow, is given the first importance, and the age of the rock, once considered paramount, still retains its importance in the secondary classification. In America opinion seems to favor as bases of classification the chemical composition, the texture, and the mineral composition, but the future must be awaited before any classification free from serious objections is likely to be adopted. The scheme which has the greatest number of followers among recent workers in petrography perhaps is the so-called quantitative classification proposed by Iddings, Cross, Washington, and Pirsson, and described in the *Journal of Geology* for 1902. The basis of this classification is chemical composition, and rocks of similar chemical character are grouped together. The chemical composition is expressed in terms of certain standard minerals, which are divided into two groups, the alkali-calcic and the iron-magnesia groups. The rocks are separated into five main classes according to the relative proportions of the minerals present belonging to the two groups. The principal defect of the scheme from a practical standpoint seems to be that an exact chemical analysis is a necessary preliminary to placing a rock in its proper class.

IGNIS FATUUS, fāt'ū-ūs (Lat., vain fire)

A luminous appearance, frequently seen in marshy places, in churchyards, and over stagnant pools. It generally appears a little after sunset as a pale, bluish-colored flame, varying in size and shape, sometimes it shines steadily till morning, at other times disappears, and reappears within about half-hourly intervals. It floats in air at about 2 feet from the ground, is sometimes fixed, and sometimes travels with great rapidity. Many efforts have been made to discover its cause, but so varied are its appearances and so void of any common principle that these attempts have failed. Two of the various explanations offered may be mentioned here. The first is that the ignis fatuus is due to phosphureted hydrogen gas, PH_3 , which possesses the property of igniting when it comes in contact with dry atmospheric air, the gas would be generated by the decomposition of animal matter present in a marshy soil. The second is that it is due to the combustion of methane, or marsh gas, CH_4 , produced by the decomposition of vegetable matter, but though this supposition satisfactorily accounts for many appearances connected with the ignis fatuus, the gas itself is not spontaneously combustible, and an additional supposition becomes necessary to account for its ignition. The probable conclusion is that a number of phenomena, apparently similar, but arising from different causes, are aggregated under the term "ignis fatuus."

The appearance of ignis fatuus is not a common phenomenon, and many distinguished naturalists who desired to investigate it have never succeeded in finding it, but it is not unfrequently seen in the north of Germany, the swamp and moorland districts in the south and north-west of England, and in the lowlands of Scotland. It is seen in the above places from the middle of autumn till the beginning of November. In former times the ignis fatuus, under the names of Will-o'-the-Wisp, Jack-o'-lantern, Spunkie, etc., was an object of superstition among the inhabitants of the districts where it appears and was believed to be due to the agency of evil spirits attempting to lure travelers to their destruction.

IGNITION See INTERNAL-COMBUSTION ENGINE AND MOTOR VEHICLES.

IGNJATOVIC, Ig-nyāt'o-vich, IAKŠA (JACOB) (1824-89). A Serbian novelist and critic, born in Szent-Endre, Hungary. He received a legal education at Budapest and elsewhere. After the revolution of 1848 he lived for some time in Paris, and he traveled extensively in south Europe. Returning to Hungary, he became editor of the *Review* (*Letopis*) of the Serbian Literary Society (Matica) and was twice elected deputy to Parliament. He wrote numerous novels, historical, humorous, and social, of which the best are *George Brankovich* (1859), historical, and *The Sufferers and Old and New Masters*, dealing with contemporary Serbian life. He also wrote short stories and political and literary essays.

IGNORANCE OF THE LAW One of the important maxims of the common law is *Ignor-*

rance of the law excuses no one It is not, however, an aphorism of universal application, nor is it to be pressed into the service of injustice, neither does it warrant the presumption that every one knows the law. There is, of course, no such presumption. Yet the rule that ignorance of law shall not serve as an excuse for illegal acts or omissions is common to all systems of law and is not only expedient but necessary.

In criminal law particularly the maxim gives expression to an important principle of public policy. To permit a person who has committed a crime to escape the penalties of his wrongdoing by the plea that he did not know that the act was a crime, would plainly be subversive of the whole system of criminal justice. Yet even in criminal cases the principle has real or apparent exceptions. If a person is indicted for larceny, he may show that he honestly believed the property to be his own, although it appeared that this belief was due to his ignorance of a rule of law which vested the property in another. This results from the fact that he does not commit the crime of larceny unless he intended to appropriate another person's property to his own use. Had the indicted person been sued for conversion by the true owner, his ignorance of the law would have been no excuse. In the civil action for conversion his motive, or intention, or belief in taking would be immaterial. One who takes and uses property as his own acts at his peril. So, if a person enters into an honest and fair contract, he cannot absolve himself from its obligations by showing that he would not thus have contracted had he known the legal consequences of so doing.

In general it may also be said that a person who has paid money in ignorance of the law cannot recover it in a quasi-contract action as money paid under a mistake. This means that no man will be permitted to exempt himself from a duty, or shelter himself from the consequences of infringing a prohibition imposed by law, or acquire an advantage in opposition to the legal rights and interests of another, by pretending error or ignorance of law. See *MISTAKE, QUASI CONTRACT*.

IGNORANTINES (from Lat. *ignorare*, to be ignorant), **FRATRES IGNORANTIE**. A religious congregation of men in the Roman Catholic church, associated for the gratuitous instruction of poor children in sacred as well as secular learning. See **BROTHERS OF THE CHRISTIAN SCHOOLS**.

IGOROT, i'gô-rô't. The designation Igorot is a term meaning 'mountain people,' which was formerly applied to all the interior people of northern Luzon. At present it is generally understood to refer to the pagan inhabitants of Bontoc, Benguet, Lepanto, and Amburayan sub-provinces. In culture these people are much alike except for the fact that those outside of Bontoc have been more modified by the white man. Both are agricultural and depend almost solely on the fields for sustenance. Like the Ifugao, they construct mountain-side terraces, to which they conduct water by means of flumes and ditches. The houses, which are grouped in villages, have grass roofs which overhang the board side walls. The ground floor is used as a sleeping apartment and general workroom, while in the roof is a dimly lighted apartment which serves as a kitchen and storeroom.

The people of both divisions are of excellent build, but the inhabitants of Bontoc are some-

what larger and more aggressive than the Benguet-Lepanto people. The Bontoc are addicted to head hunting and until recent years have been ardent warriors. Their villages are divided into *atos* (or divisions), in each of which is to be found a special house for the unmarried men and boys, while a similar structure serves for the girls. The Philippine census of 1903 stated the total number of the Igorot people as 211,520.

While less aggressive than the people of Bontoc, the Benguet-Lepanto Igorot have developed further in many ways, and are now, as they have been for many centuries, miners and workers in gold and copper. Consult Jenks, *The Bontoc Igorot* (Manila, P. I., 1905). See **PHILIPPINE ISLANDS**.

IGOR'S (é'gôr'z) **BAND**, **SONG OF** (Russ. *Slovo o polku Igorevê*). An early Russian prose narrative, of uncertain date. It recites the unfortunate outcome of the expedition (1185) of Igor (Scand. Ingvar), Prince of Novgorod-Syever'sk, into the country of the Polovtsy in southern Russia. The Prince was defeated and taken prisoner, but later he escaped with the help of a slave. This song, so called, is not contemporary with the events it relates. Generally admired are the lyric passages depicting the grief of Nature over the Prince's capture, the lament of Yaroslavna, his consort, on hearing of his fate, and the escape of Igor. The original manuscript, discovered by Count Musin-Pushkin and published in 1800, was destroyed in the Moscow fire of 1812. The editing was very poor, and another copy found in 1864 among Catharine II's papers is hardly more satisfactory. Its authenticity has been an object of bitter controversy, and a vast literature on the subject has grown up. A translation by Wolfsohn in *Schönwissenschaftliche Literatur der Russen* (Leipzig, 1843) and one with introduction and notes by Paucker (Berlin, 1884) are very good. There are also French translations by Rambaud (*La Russie épique*, Paris, 1876) and others. There is an English translation by Wiener in *Anthology of Russian Literature*, vol. 1 (New York, 1902).

IGRAINE, i-grân'. See **IGERNA**.

IGUALA, or **IGUALA DE ITURBIDE**, é-gwa'la dâ é'tô'r-bê'dâ. A town in the State of Guerrero, Mexico (Map Mexico, J 8). It is in a rich mining and agricultural district and is the largest town of the state. The first silver mines worked by the Spaniards in Mexico were near here. It has a prominent place in Mexican history from the fact that the Plan de Iguala, or the Plan of the Three Guarantees, was announced here by Iturbide on Feb. 24, 1821. (See **MEXICO, HISTORY**.) In 1907 a severe earthquake destroyed many buildings in the town. Pop., 1910, 8195.

IGUALADA, é-gwa-la'pa. A city in the Province of Barcelona, Spain, situated on the river Noya, in a mountainous but fertile district, 46 miles by rail northwest of Barcelona (Map Spain, F 2). It was formerly a fortified town, but its walls are now in ruins. It has manufactures of cotton, linen, and other textiles. The famous mountain and Benedictine monastery of Monserrat lies 12 miles to the east. Pop., 1900, 10,476. 1910, 11,754.

IGUANA, i-gwa'nâ (Sp., from the Haitian name, *igoana*, *huana*, *yuana*). A genus of tropical American lizards, representing the family Iguanidae, of which there are about 55 genera and 250 or more species. In external and internal structure iguanas closely resemble the Agamidae.

of the Old World and are distinguished mainly by the pleurodont dentition. The tongue is thick and villous. All the North American forms possess femoral pores, but few of the South American species have them. In habits also the Iguanidae closely resemble the Agamidae, save that

TEETH OF AN IGUANA

there are no flying forms to correspond with the flying dragon of the Agamidae, while in America some of the iguanas, such as *Anolis*, have digital expansions, and others are semimarine, neither of which conditions is met with in the Old World family. The family contains several of the largest lizards. Most of the species are arboreal, but some of them live on the surface of the sand and stones of the desert and have a depressed form. Several species live wholly, or almost wholly, on vegetable food—the blossoms and leaves of plants. For this reason the flesh of several of them, especially of the genus *Iguana*, is very palatable, is sought by the natives of Central and South America as food, and is sold in their markets in considerable quantity. One of the species most eaten is *Iguana tuberculata*, a repulsive-looking lizard, with a high, dorsal, fringed ridge and a large dewlap. (See Plate.) It basks on the limbs of trees during the warm hours and while thus situated seems rather indifferent to the approach of man. It is fond of music and of having the body stroked. The natives take advantage of these facts, whistle a lively tune as they approach, and when near enough stroke the sides of the iguana with a stick until they succeed in getting a noose over its head. (Consult Belt, *Naturalist in Nicaragua*, London, 1888.) The natives also dig them out of their burrows or chase them into trees with dogs trained for the purpose. On the Galapagos Islands there is a semiaquatic genus, *Amblyrhynchus*, whose species feed on seaweeds along shore. This lizard is described in detail by Darwin, in chap. v of his *Naturalist's Voyage* (London, 1860). There are other species of the same genus that live for months without water by feeding on the succulent cactus. The great iguana of Jamaica, with the prominent serrate crest, is *Cyclura lophoma*. In the southwestern United States, from western Kansas to southern California and Mexico, dwell several genera of green, dark-gray, or brown iguanid lizards, such as *Uta*, *Holbrookia* (q.v.), *Ctenosaura*, and *Crotaphytus*. (See COLLARED LIZARD.) The large genus *Sceloporus* ranges not only over the western and central parts of the United States, but in all the eastern and Gulf States as far north as New Jersey and Indiana. Another widely distributed genus, *Anolis*, has two representatives in the South Atlantic States, popularly called chameleons. (See ANOLIS.) These lizards possess mimicry of color in a remarkable degree and have a considerable power of changing their color. They are insectivorous, and the wanton destruction of them is much to be deplored, for in their native habitats they are of considerable economic importance to agriculture. To this family belongs also the basilisk of Central and South America, so named on account of its fancied resemblance to the creature

of fable. (See BASILISK.) It is a large, harmless lizard, found no farther north than southern Mexico. The family also includes those peculiar, spiny, short-tailed, flattened lizards known as hoined toads. (See HORNED TOAD.)

Consult G. A. Boulenger, *Catalogue of Lizards of the British Museum* (London, 1885), J. S. Kingsley (ed.), *Standard Natural History*, vol. 11 (Boston, 1885), L. H. Stejneger, *Death Valley Expedition* (Department of Agriculture, Washington, 1893), E. D. Cope, *Crocodylians, Lizards, and Snakes* (Smithsonian Institution, 1893), Hans Gadow, *Amphibia and Reptiles* (New York, 1901). See LIZARD.

IGUANODON, i-gwān'ō-dōn (Neo-Lat., from Eng. *iguana* + Gk. *ōdōs*, *odous*, tooth). A genus of ornithomimid dinosaurs, found fossil in Jurassic and Lower Cretaceous rocks of Europe. *Iguanodon* is perhaps the first dinosaur brought to light, for it was described by Mantell in 1825 from specimens found in Kent, England. The animal was 15 to 25 feet long, the head was large and narrow, the jaws heavy and furnished with numerous teeth of peculiar form that resemble those of the modern American lizard, *Iguana*. The anterior portions of the jaws are provided with strong, horny beaks like those of turtles. The fore limbs have four toes and a "spur" and are much shorter than the heavy three-toed hind limbs. The pelvis is elongated and the tail heavy, and there is a ridge of strong vertebral spines extending along the dorsal surface from the neck to the middle of the tail. All the bones are hollow. *Iguanodon* was an herbivorous dinosaur that walked on its hind legs and sat on a tripod formed by the hind legs and tail, after the manner of the kangaroo. It lived in great numbers in the swampy regions of England and Belgium and other parts of Europe during Jurassic time, as indicated by the mode of occurrence of its fossil skeletons, 29 of which were found at one time in Upper Jurassic sandstones of the coal regions at Bernissart, Belgium. *Iguanodon* has not been found in the Mesozoics of America, where it is represented by similar genera *Camptosaurus*, *Laosaurus*, and *Thespesius*. A very instructive account of the discovery and early history of *Iguanodon*, illustrating the method by which fragmentary material has after careful work yielded valuable results, is to be found in Mantell's *Petrifactions and their Teachings* (London, 1851). See also Woodward, *Outlines of Vertebrate Paleontology for Students of Zoology* (Cambridge, 1898). For more specialized articles, consult Dollo, "Quatrième note sur les Dinosauriens de Bernissart," in *Bulletin du Musée Royal d'Histoire Naturelle de Belgique*, 11 (Brussels, 1883), Woodward, *Geological Magazine* (London, 1895), Knipe, *Evolution in the Past* (1b, 1912). See CAMPTOSAURUS, DINOSAURIA.

IGUAZÚ, e'gwa-sōō'. A river of Brazil, which rises near the Atlantic Ocean in the State of Paraná, flows westward for about 790 miles, and empties into the Paraná River (Map: Argentina, J 3). It forms most of the boundary between the states of Paraná and Santa Catharina and also for a short distance between Brazil and Argentina (Misiones). The middle course is navigable for river steamers for some distance. The lower course is broken by numerous cascades and falls, some being from 30 to 90 feet in height. About 11 miles from its mouth are the wonderful Falls of Iguazú, one of the most magnificent cataracts in the world.

IGUANAS AND OTHER AMERICAN LIZARDS

1. IGUANA (*Iguana tuberculata*).
2. GREEN LIZARD (*Anolis principalis*).
3. NORTHERN HORNED TOAD (*Phrynosoma Douglassi*);
top of head, and profile.
4. CHUCKWALLA (*Sauromalus ater*).

5. LEOPARD LIZARD (*Crotaphytus wislizeni*).
6. DESERT LIZARD (*Callisaurus draconoides*); head and
hind limb.
7. GILA MONSTER (*Heloderma horridum*).
8. COMMON HORNED TOAD (*Phrynosoma cornutum*).

The Falls are formed by a double drop, each having a fall of about 180 feet. In the dry season there are two crescents, known respectively as the Argentine and Brazilian falls, each with a width of 800 yards. In the wet season the two are joined into one vast fall of some 4000 yards in width. Situated in the midst of a virgin tropical forest, the Falls are difficult of access. Those who have visited them say they surpass Niagara in magnitude and splendor. Consult Manuel Bernárdez, *De Buenos Aires al Iguazú* (2d ed., Buenos Aires, 1901).

IHNE, *é'ne*, **WILHELM** (1821-1902) A German historian, born at Furth, and educated at Bonn (1839-43). He was private tutor in England (1843-47) and returned to Liverpool, where he had charge of a school (1849-63), after two years' teaching at Elberfeld. In 1863 he went to Heidelberg, where he was made professor in 1873. He wrote *Questiones Terentianæ* (1843), *Researches into the History of the Roman Constitution* (1853), *Plea for the Emperor Tiberius* (1856), a *History of Rome* (1871-82), of which the German edition was published later, and *Early Rome* (1876).

IHRE, *é're*, **JOHAN** (1707-80) A Swedish scholar of Scottish extraction. He was born at Lund and educated at the University of Upsala, where he acquired a great reputation and carried off the highest honors. He subsequently traveled in France and England, was appointed underlibrarian to the Academy of Sciences on his return to Sweden, and rose through a variety of offices to be professor of belles-lettres and political economy (1748). Ihre's principal work is his *Glossarium Suogothicum* (1769), which may be regarded as the foundation of Swedish philology. It was published at the cost of the state, which gave Ihre \$10,000 to execute it. His numerous academical disputations, amounting to upward of 450, are still valuable, especially those on the Mæso-Gothic version of the Gospels by Ulfilas.

I H S See **ABBREVIATIONS**

II KAMON NO KAMI, *é-é ka'môn nô ka'mê*, or **II NAOSUKE**, **BARON** (1815-61). The Japanese statesman whose wise and vigorous statesmanship led to the opening of Japan to foreign nations and the establishment of friendly relations with them. He was the fourteenth son of Baron Ii, of Hikone on Lake Biwa, and was born of a line of ancestors known honorably in the tenth century. At 21 Ii went to Yeddo and had his mansion within the inclosure of Yeddo Castle at Sakurada, or Cherry Field. In 1850 he was made heir to the barony, assuming the highly honorable title of Kamon no kami, which gave him standing at the Shogun's court. In 1853 the question of foreign intercourse, precipitated by Commodore Perry, divided the opinions of the daimyos. Although he shared with many a feeling of hatred towards foreigners, Ii drew a line of distinction between personal feelings and national interests and declared himself to be in favor of intercourse with foreigners and of a revival of the military spirit for national defense. The Shogun Iyesada being childless and in poor health, the question of appointing an heir added to the complication of the period. Pressed

by Townsend Harris (*qv*) to sign the treaty which he had negotiated, and which the Mikado's court in Kyoto opposed, the Shogun had to face a crisis which admitted of no delay. On June 4, 1858, two days after the Mikado's refusal to approve the treaty, the Shogun appointed Ii to be Tairo or Regent, and on the 5th he was publicly installed, as the virtual ruler of Japan, but acting in the name of the Shogun. The Shogun Iyesada died suddenly, August 15, leaving no heirs. Carrying out his master's wishes, Ii appointed Kikuchiyo, who subsequently took the name of Iyémochi, the Prince of Kiushu, then a child of 12, to be his successor, and, taking the responsibility, in view of the rapid approach of the squadrons of the Russians, British, and French after their victorious campaign in China, he signed the liberal treaty drawn up by the United States Minister. The treaty with Great Britain followed on August 26 and that with France on October 9.

The great daimyos of Mito, Owari, and Echizen, however, opposed his nominee to the shogunate, the two former daimyos wishing also to have Echizen made Regent. On the outbreak of the long-gathering storm of opposition Ii crushed his enemies with a strong hand and dispatched an embassy to the United States to ratify the treaty. Among other triumphs he had the Princess Kazu, aunt of the present Emperor, betrothed in marriage to the young Shogun, and they were married in Yeddo in 1861. Before this, on the 23d of March, 1861, a snowy day, while on his way in his palanquin with a large following of bodyguards to the palace in Yeddo, they were attacked by a band of 18 assassins—17 from Mito, one from Satsuma, all of them Ronins. In the fight which ensued Baron Ii himself was stabbed, and his head cut off and carried away to the castle town of Mito and there exposed on a pole. For years the name Ii rested under a cloud, but it has been cleansed by Shimada Saburo in his book *Kai Koku Shimatsû* (Opening of the Country, Beginning and End), which has been translated into English under the title of *Agitated Japan* (1896). The man and the episode of his assassination have given rise to a considerable body of native literature, and the episode is treated in fiction by A. C. Maclay in *Mito Yashiki* (3d ed., 1899).

IIWI, *é-é'vé*. The English spelling by many voyagers of the name of a Hawaiian bird, otherwise known as mamo (*qv*), whose scarlet plumage was used for the native feather cloaks.

IKAU, *é-ka'ô*. A famous summer resort of Japan, situated in the Province of Kotsuke, about 20 miles by rail from Takasaki, and 88 miles from Tokyo. It is built on the slopes of the Haruna Mountain and is celebrated for the picturesqueness of its situation as well as for its two hot springs and rich vegetation. The mineral springs have a temperature of 113° F. and contain iron and sulphate of soda.

IK MARVEL, *ik mar'vel*. See **MITCHELL**, **DONALD GRANT**

IKUNO, *é-kû'nô*. A mining town of Japan, situated at an altitude of 1200 feet, in the Prefecture of Hyogo, about 35 miles northwest of Kobe, and 31 miles by rail from Himeji (Map: Japan, D 6). Its silver mines, the second largest in Japan, are operated by the government. Over 1500 persons are employed, and the mines are worked day and night. Besides silver they also yield gold. Pop. (est.), 3000.

ILAGAN, *é-la'gan*. The capital of the Prov-

ince of Isabela in Luzon, Philippines (Map Philippine Islands, C 2) It is situated at the mouth of the Grande de Cagayan, 270 miles north-northeast of Manila, and 36 miles north-west of Palanan, its nearest port Its tobacco industry is important Pop, 1903, 16,008

ILCHI, ēl'chē A city of China See KHOTAN

ÎLE DE FRANCE, ēl de frāns. The former name of Mauritius (qv), an island in the Indian Ocean

ÎLE DE FRANCE One of the old provinces of France, having Paris as its capital, and now mostly comprised in the departments of Seine, Seine-et-Oise, Seine-et-Marne, Aisne, and Oise During the last century of the Carolingian dynasty, the Ile de France was possessed by a race of powerful nobles who took the title of dukes of France One of the ablest of these was Hugh, or Hugues, surnamed the Great, or the White, who for 20 years previous to his death (956) virtually wielded the sovereign power under the Carolingian kings Louis IV and Lothar His son Hugh Capet eventually became the actual sovereign Consult A Longnon, "L'Île de France," in *Mémoires de la Société de l'Histoire de Paris et de l'Île de France*, vol 1 (Paris, 1875), and E W Rose, *Cathedrals and Cloisters of the Isle de France* (2 vols, New York, 1910).

ÎLE DE RE See RE, ÎLE DE

ILEOCÆCAL (il'ē-sē'kal) **VALVE** A valvular constriction that guards the passage between the large and the small intestine, at the opening of the cæcum It consists of a double fold of mucous membrane and is present in all mammals except certain carnivora

ILERDA. See LÉRIDA

ILEUM. See INTESTINE

ILEUS (Neo-Lat, from Lat *ileos*, Gk *ελεός*, *eileos*, *λεός*, *leos*, severe colic, from *ελεῖν*, *eilein*, to roll up, connected with Lat *volvare*, to roll, Eng *wallow*) A severe colic, due to intestinal obstruction Its symptoms are pain, nausea, and vomiting—which latter may contain feculent matter—rapid and feeble heart, and collapse The obstruction may relieve itself, or, if of mechanical origin, it may require operative interference to save life

I'LEX (Lat, holm oak) A tree often named in the Latin classics, the evergreen oak or holm oak (*Quercus ilex*) It is a native of most parts of the south of Europe and of the north of Africa and often attains large dimensions Its leaves are ovate-oblong, acute, leathery, hoary beneath, but they vary much in some respects, from the size of a sloe leaf to that of a beech and from being very spiny at the edge to perfect evenness Its wood is very hard and heavy, tough, durable, and useful, particularly for axles, pulleys, screws, and whatever is to be subjected to much friction. The acorns are of various quality, sometimes bitter and sometimes sweet and eatable In modern botany *Ilex* is the generic name of the holly (qv)

ILFORD, il'fērd An urban district in Essex, England, on the Roding, 7 miles east-southeast of London (Map London, D 9) Its modern growth and importance are due to the photographic industry, the establishment of dry-plate works, and a paper mill The erection also of the London County Council's Claybury Hall Lunatic Asylum, holding 2000 persons, has been instrumental in adding to the population The chapel of the twelfth-century mediæval hospital

of St Mary and St Thomas is of archæological interest The British Museum contains fossil remains of mammoths discovered here Across the river is Little Ilford Pop, 1891, 10,913, 1901, 41,244, 1911, 78,205

ILFRACOMBE, il'fra-kōōm A market town, seaport, and watering place on the north coast of Devon, England, finely situated amid picturesque irregular hills, on an inlet of the Bristol Channel, 11 miles north of Barnstaple (Map England, B 5) The harbor is formed by ramparts of rock and furnished with a lighthouse and a pier The climate is mild, and it has an excellent promenade Fishing is still an active industry, but shipping has declined It is an old town and in the fourteenth century was of considerable commercial importance Pop, 1901, 8557, 1911, 8935

ILGEN, ēl'gen, KARL DAVID (1763-1834) A German philologist and educator, born at Burg-holzhausen in Saxony and educated at Leipzig In 1789 he became rector of the Gymnasium at Naumburg, in 1794 professor of Oriental languages at Jena, and in 1802 rector of the Landesschule at Pforta, where he labored with conspicuous success for nearly 30 years His main works are *De Jobi Natura atque Virtutibus* (1788), *Urkunden des ersten Buches Moses in ihrer Urgestalt* (1798), *Die Geschichte Tobas nach drei verschiedenen Originalen übersetzt* (1800), *Hymni Homericæ* (1796), *Scolia Græcorum* (1798), *Opuscula Varia Philologica* (1797), *Anmadversiones ad Vergiliæ Copam* (1820). Consult Naumann, *Ilgeniana* (Leipzig, 1853)

IL GRECCHETTO See CASTIGLIONE, GIOVANNI BENEDETTO

ILI, ē'lē' A river which rises, under the name of Tekes, in the Tian-Shan Mountains, on the borders of Russia and China, not far from Lake Issyk-kul, flows at first in a northeasterly and then in a westerly direction, passing the town of Kuldja, and falls into Lake Balkhash in the Russian Central Asiatic Province of Semiretchensk (Map Asia, J 4) It is about 800 miles long, flows through a fertile and populous valley stocked with sheep and cattle, and is navigable from Kuldja

ILIAC ARTERIES. The two arteries formed by the bifurcation of the abdominal aorta The aorta (qv) divides at its lowest point—which is usually on the left side of the body of the fourth lumbar vertebra—into the two common iliac arteries, which pass downward and outward on each side to the margin of the pelvis for about 2½ inches and then divide into the external and internal iliac artery of either side The external iliac passes obliquely downward and outward to the femoral arch, when it enters the thigh and becomes the femoral artery The internal iliac is a short vessel, about 1½ inches in length, which divides into an anterior and a posterior trunk The anterior trunk divides into several branches, which supply the bladder, the rectum, the generative organs, and muscles both within and on the outside of the pelvis, with arterial blood, while the branches of the posterior trunk mainly supply muscles within and on the outside of the pelvis The importance of the internal iliac artery in carrying on the circulation in uterine life is noticed in the article FÆTUS

ILIAD. See HOMER

ILIAD OF FRANCE, THE A name sometimes given to the *Roman de la Rose* (qv).

ILIAN TABLET. See TABULA ILIACA.

ILIJC, il'ich, DRAGUTIN (1858—) A Serbian poet and critic. Besides some poems, his important works in prose are *Novels* (1892), *Splendid Pictures from the First Days of Christianity* (1896), *The Last Prophet* (1897), and several dramas.

ILIJC, JOVAN (1823-1901) A popular Serbian poet, born in Belgrade and educated at Kragujevac, Belgrade, and Vienna. He took part in the revolution of 1848-49 as a volunteer against Hungary, returning to Serbia, he became a member of the Supreme Court and from 1869 to 1873 he was Minister of Justice. There have been four editions of his poems, which are mostly written in the manner of Serbian folk poetry. The *Bysmylach* and the *Dervish Baba* are, however, of Oriental character. His prose writings are less important. His three sons were all writers.

ILIJC, VOYISLAV (1862-94). An important Serbian poet, born in Belgrade, he died in Pustina (Albania) while Serbian Vice Consul. The youngest and favorite son of Jovan Iljc, he thoroughly studied Russian literature, being greatly influenced by Pushkin. He appeared before the public with his poems, chiefly elegiac, about 1880, and during the following 15 years held a leading position among the poets of his nation, giving a new direction to Serbian poetry. A complete collection of his poems, originally published in various periodicals, appeared in 1907. He also wrote in prose, and left an unfinished tragedy, *Radoslav*.

ILION, il'i-on. A village in Herkimer Co., N. Y., on the Mohawk River and Erie and Baige canals, 12 miles east-southeast of Utica, on the New York Central and Hudson River and the West Shore railroads (Map New York, E 4). It has a fine public library and a hospital. The manufactures include firearms, typewriters, store fixtures, knit goods, and cabinet and filing cases. The water works and electric-light plant are owned by the municipality. One or two families seem to have moved to the site of Ilion about 1816, but there was properly no village here until about 1828. It was incorporated in 1852. Pop., 1900, 5138, 1910, 6588.

ILION, ILIOS. See ILUS, TROY.

IL'IONA (Lat., from Gk. Ἰλιόνη, Ἰλιονή). In Greek mythology, the wife of Polymestor, King of Thrace. She was the daughter of Priam and Hecuba and according to one legend brought up her brother Polydorus, who had been committed to the care of Polymestor. When the latter, instigated by the Greeks, who wished to exterminate the race of Priam, designed the murder of Polydorus, Ilona substituted his own son, Deipylus, who was put to death instead. According to a story given by Vergil, *Aeneid*, III, 50 ff., Polymestor murdered Polydorus for the sake of a great sum of gold Priam had sent with Polydorus for safe keeping.

ILIONEUS, i-l'ō-nūs (Lat., from Gk. Ἰλιόνηος). The son of Niobe, killed with all her other children. He was praying, and Apollo would have saved him if the arrow had not already been sent.

ILITHYIA, il'i-thi'ya (Lat., from Gk. Εἰλεθυία, Εἰλεθυία). The Greek goddess who presided over childbirth. The plural form (Ilithyiae) is used in the *Iliad*, but elsewhere only one goddess of the name is mentioned.

ILIUM. See TROY.

ILIUM (Lat., flank). A portion of one of

the bones of the pelvis, the os innominatum. In the undeveloped child it is a distinct portion, which afterward becomes united to the pubis in front and to the ischium behind and below. It is the hip bone, or haunch bone. See PELVIS.

ILKESTON, il'kēs-ton. A market town in Derbyshire, England, 9 miles northeast of Derby, on an eminence in the valley of Erewash (Map England, E 4). There are manufactures of hosiery, lace, and stoneware, and coal and iron works in the vicinity. The town has a medicinal mineral spring and baths, which are now closed. It obtained a grant for a market and fair in 1251, but was incorporated in 1887. It owns its gas, water, markets, and cemetery. Pop., 1901, 25,384, 1911, 31,673.

ILKHANS, el-kanz'. See MONGOL DYNASTIES.

ILLÆNUS, il-lē'nūs. An important genus of trilobites, the type of the family Illænidæ, characterized by its large convex cephalic and caudal shields which are nearly smooth, both the glabella of the former and the axis of the latter being indistinct. The thoracic segments, usually 10 in number, are also smooth. The genus is represented by numerous species in the Ordovician and Silurian of Europe, Asia, and North America. See TRILOBITA.

ILLAMPU, ē-lyam'pōō. A mountain of the Andes. See SORATA.

ILLA-TICSI, ē'lya-tēk'sē (Quichua, Eternal Light). A name given to the supreme god of the Peruvians, Uiracocha.

ILLE-ET-VILAINE, ēl'-ā'-ve'lān'. A maritime department in the northwest of France, a portion of the old Province of Brittany, lying between the English Channel and the Department of Loire-Inférieure (Map France, N, D 4). Area, 2699 square miles. Pop., 1911, 608,098. It is watered chiefly by the rivers from which it derives its name—the Vilaine, and its tributary, the Ille. Flax, hemp, wheat, buckwheat, oats, barley, potatoes, and fruits are extensively produced, and the cider of this district is esteemed the best produced in the country. The department is famous for its dairy products. Cattle are reared in great numbers, iron, zinc, and lead are worked, and great varieties of linen and woolen fabrics are manufactured. The seaports have large fisheries and yearly equip fleets for the Newfoundland banks. Rennes is the capital, and Saint-Malo the principal seaport.

IL'LEGALITY. A legal condition or status resulting from the performance or attempted performance of an act forbidden by law. The act may be a contract or a conveyance or devise of property for a forbidden purpose or in violation of some principle of public policy, and the effect of the illegality is to render the transaction ineffectual as a legal act and, therefore, unenforceable in any proceeding at law or in equity. Illegality may result either from a statute prohibiting an act, as gaming or the taking of usury, or from general considerations of morality and public policy, as in the case of agreements for illicit cohabitation or conveyances in fraud of creditors. Hence we have the classification of such acts as evils prohibited by law (*mala prohibita*) and acts wrongful in themselves (*mala in se*).

The doctrine of illegality finds its most frequent application in the law of contracts. It is a general rule that the law will never give its aid to a party in the enforcement of an illegal contract into which he has entered, whether the same be in direct violation of a statute, against

public policy, or opposed to public morals. This rule is, however, subject to the qualification that, in the case of *mala prohibita*, an innocent party to such a contract, as where a debtor pays usurious interest, is not estopped from asserting such rights as he may have thereunder. But where the parties are *in pari delicto*, as is usually, if not always, the case, where the transaction is *malum in se*, the rule is rigorously applied to each and every one of

the children of a man and woman cohabiting professedly as husband and wife are legitimate. In France, where informal unions are common, this rule does not hold. Children of such a union are considered illegitimate. A great variety exists as to theory and practice in different lands, and reference must be made to special treatises on the subject. Illegitimacy has been much discussed from three distinct points of view—the moral, the economic, and the legal.

COUNTRY	1900			1910		
	Total births	Illegitimate	Per cent illegitimate	Total births	Illegitimate	Per cent illegitimate
England and Wales	926,304	36,314	4.00	896,962	36,635	4.10
Ireland	101,459	2,702	2.70	101,963	2,833	2.80
Scotland	131,355	8,503	6.50	124,000	8,492	7.00
Germany	* 2,045,286	* 183,504	* 8.90	1,982,836	179,584	9.10
France	827,297	73,121	8.80	774,390	66,978	8.60
Belgium	* 194,268	* 14,919	* 7.68	176,413	10,837	6.10
Italy	1,067,376	63,406	6.00	1,144,410	56,615	4.10
Holland	162,611	4,247	2.60	166,527	3,327	2.00

* 1899

† 1898

them. The defendant in a suit based on such a contract is permitted to set up the illegality, as a defense, not from any tenderness for him, but because, under our procedure, there is no other way in which the plaintiff can be prevented from enforcing the illegal obligation.

But the law has not been content merely to refuse to lend its aid to the accomplishment of an illegal purpose. It goes further and refuses to allow its process to be used to undo an illegal act by restoring the parties to their former condition. Thus, if one has paid a consideration or made a conveyance or mortgage for an illegal purpose, as to compound a felony or as a reward or inducement for illicit cohabitation, the courts will refuse to recognize the illegality of the transaction as a ground for rescinding it. Thus, in the case of a mortgage given for an illegal purpose, the mortgagee cannot foreclose nor the mortgagor redeem. The parties are simply left in the predicament in which they have placed themselves.

On the other hand innocent third parties are always entitled to relief against an illegal transaction, as when a creditor seeks to set aside a conveyance or contract made in fraud of creditors.

For specific applications of the principle of illegality in conveyances of land, see CONDICTION, and, in relation to corporate acts, CORPORATION, ULTRA VIRES.

ILLEGITIMACY (from Lat *in*, not + *legitimus*, legal, from *lex*, law). According to the civil and statute law as found in many states, the status of children born out of wedlock. In England children born out of wedlock have been held as illegitimate even upon subsequent intermarriage of the parents, also children of the deceased wife's sister have long been considered illegitimate. In Italy much confusion has arisen as to legitimacy, owing to the strife between church and state. It has been held that children resulting from marriages which had been solemnized by the church only were illegitimate, a civil marriage being necessary to give legitimacy to offspring.

Where common-law marriages are recognized

A remarkable fact illustrated by the accompanying tables is the low degree of variation in the rate of illegitimacy of the several countries during the lapse of a decade. The constancy of the rate points to social conditions deeply fixed in the national life. The following table for the German Empire and a number of its constituent states illustrates the same fact.

PERCENTAGE OF ILLEGITIMATE BIRTHS

	1900	1905	1910
German Empire	8.7	8.5	9.1
Prussia	7.3	7.2	7.7
Bavaria	13.2	12.6	12.2
Saxony	12.6	13.4	14.9
Wurttemberg	9.7	8.6	8.3
Baden	7.6	7.2	7.9
Hesse	7.9	6.9	7.6
Mecklenburg-Schwern	11.7	11.8	14.0
Saxony-Weimar	9.6	10.6	11.5
Oldenburg	5.5	5.5	5.7
Braunschweig	10.0	10.2	11.8
Anhalt	9.1	10.7	12.4
Schaumburg-Lippe	4.4	3.3	4.2
Alsace-Lorraine	8.7	8.5	9.1

For the Empire as a whole a slight reduction in the illegitimacy rate has taken place in the last 60 years, as the following table indicates.

AVERAGE PERCENTAGE OF ILLEGITIMATE BIRTHS IN THE GERMAN EMPIRE

Period	Per cent	Period	Per cent
1851-60	11.5	1881-1890	9.3
1861-70	11.5	1891-1900	9.1
1871-80	8.9	1901-1910	8.6

Of all subjects for statistical investigation, illegitimacy presents perhaps the most difficulties, owing to the lack of agreement among different legal authorities as to what constitutes illegitimacy and to the fact that it is a phenomenon naturally subject to concealment. Complete figures up to date cannot be secured, it

appears, however, that in civilized lands children born out of wedlock vary from 3 per cent to 12 per cent of all births. In most cases figures on illegitimacy exclude stillbirths.

Attempts have been made to demonstrate statistically the causes of illegitimacy, but with little success. The study, e.g., of the fecundity of women throws very little light upon it. In Russia, in 1896, the number of births to 10 marriages was 65, while the number of illegitimates was only 31 to 1000 births. During the same period in France there were only 27 births to 10 marriages, with 88 illegitimate births per 1000. In Austria there were 44 births to 10 marriages, and 145 illegitimates per 1000 births, and England showed about 36 births to 10 marriages and 42 illegitimates to 1000. It seems evident that the apparent strong tendency to childbearing cannot explain the phenomenon.

Equally uncertain is evidence gathered to show that climatic conditions have any large part to play. The following table (for 1896) presents some figures bearing upon the geographic distribution of illegitimacy. The division of cities is roughly made, those in the first column being north of lat. 52° N and those in the second column south of lat 49°.

ILLEGITIMATES PER 1000 BIRTHS

Northern		Southern	
Rotterdam	70	Naples	86
Hamburg	138	Venice	189
Berlin	154	Milan	204
St Petersburg	276	Paris	268
Copenhagen	279	Rome	194
Stockholm	396	Vienna	449

As is seen by the table, the difference is scarcely worth considering. It certainly does not corroborate the view that the southern cities are less moral than the northern.

It has long been believed that the moral conditions of the cities are lower than those of rural districts. Increased knowledge of rural conditions has tended to qualify this view. In general, it may be said that the rate of illegitimacy is higher in cities than in the country. This is due to a variety of causes. There is in the city less social restraint, less danger of detection of paternity, and a greater degree of abandonment on the part of the females. In some instances, however, as in Bavaria and in some other continental countries, the greater freedom of marriage laws and better industrial opportunities in the city render family life more convenient and irregular relations less common than in country districts, where the conditions of holdings hinder marriages. The high degree of illegitimacy is often an indication of certain laws which affect the situation, as, e.g., was the case in Bavaria. In former times the laws were extremely unfavorable to marriage, and a high rate of illegitimacy resulted. The rate of illegitimacy was as follows: 1865-69, 20.59 per cent, 1871-80, 12.86 per cent, 1887-91, 14.01 per cent. With the passing of more liberal marriage laws the number of marriages rapidly rose, and a corresponding fall in the number of illegitimates took place. The number of marriages increased in the period from 1840 to 1870 from 65 per 10,000 population to 81 per 10,000 population; at the same time the rate of illegitimacy fell from 20.59 per 100 births to 12.86 per 100. From this point

VOL. XI.—49

there has been no considerable further decline, the rate in 1910 being 12.2.

Laws instituting an inquiry as to parentage have so far had little effect in checking illegitimacy. The following table will serve to illustrate this feature of the case.

RATE PER 1000 CHILDREN BORN, PERIOD 1878-82, STILLBIRTHS EXCLUDED

Countries where inquiry as to paternity is refused	Rate per 1000 births	Countries where inquiry is allowed	Rate per 1000 births
Belgium	77	Austria	144
France*	74	Saxony	127
Italy	73	Bavaria	132
Holland	30	Sweden	101
Russia	28	Denmark	101
		Scotland	84
		England and Wales	48
		Switzerland	47
		Ireland	25

* The inquiry as to paternity is now permitted in France, but the present percentage of illegitimacy is 8.6.

The presence in society of illegitimate children might be expected to involve serious economic and moral evils, since they are frequently deserted by their natural protectors, and since by heredity and environment they would naturally tend towards pauperism and crime. The greater death rate among this class of children diminishes these social and economic effects. The following table shows the death rate among infants under one year in each class, in the countries named.

COUNTRY	Per cent deaths among legitimates	Per cent deaths among illegitimates
Austria	24.5	33.3
France	15.5	30.0
Belgium	16.1	26.2
Norway	9.9	12.16
Prussia	19.3	34.8
Bavaria	29.3	38.6
Württemberg	29.6	36.4
Berlin	25.0	32.8

The death rate among illegitimate children in most countries is declining, but not more rapidly than the death rate among the legitimate. The best comparative study through a period of time covers the Kingdom of Saxony only (Prenger, *Die Unehelichkeit im Königreich Sachsen*, Leipzig, 1913). The following table gives the results of this study.

DEATHS OF CHILDREN UNDER ONE YEAR PER 100

	Legitimate	Illegitimate
1881-85	26.71	38.31
1886-90	26.67	39.02
1891-95	26.49	38.69
1896-1900	25.07	36.50
1901-05	23.35	32.92
1906-10	18.72	26.07

Investigations undertaken to show the physical and moral development of illegitimates are inconclusive in results. This question has been studied in Germany, and most experiments seem to show that illegitimates do not differ greatly

from the normal. For example, of 277 illegitimates examined for military service in Berlin in 1870, there were 90 accepted, of the same number of legitimates, 95 were accepted. Among criminals investigations have shown that the illegitimates furnish a large number of those arrested for theft and for begging.

An important question from the standpoint of the economist and public financier is the burden imposed by illegitimacy upon the public. It may work against the welfare of the state by unduly increasing the population, because it removes the feeling of responsibility felt by those who know they must support those whom they bring into the world. The more practical and immediate aspect of the problem, however, is the expense the state must meet in caring for the illegitimates. The importance of this item depends on three conditions: first, the actual number of those thrown on the public, second, the share of this burden borne by private charity, third, the degree of responsibility placed on the reputed parents as to the support of the illegitimate children. This leads to a detailed study of charity work, however, for which reference must be made to that head.

As to the support of illegitimates, the common-law rule is that the putative father of a bastard child is not liable for its support, this obligation falling legally on the mother.

By statute law, both in England and most of the United States, upon complaint of the mother or of certain designated public officers, an inquiry may be had as to the identity of the putative father, and upon sufficient proof an order of affiliation made whereby the father is adjudged to pay for the support of the child.

Under common law an illegitimate child can neither inherit nor transmit property. The exception to this rule is that to his own offspring he may will property of his own accumulation. Laws of the United States have modified this condition and, as a rule, allow inheritance and transmission of property through the mother.

The legitimation of children born out of wedlock by statute law in most of the States follows upon the intermarriage of the parents and acknowledgment of the children. The legitimation of illegitimates secures them, in general, all the privileges of children born in wedlock. It therefore carries with it the right of property and inheritance and the name of the father. In England the intermarriage of the parents at any time before the birth of the child legitimates the child. English law recognizes the status of the child in the place where the parents were domiciled. In the civil and canon law the intermarriage of parents has always made the child legitimate. This is the law of Scotland, Holland, Germany, and France. Consult Lefingwell, *Illegitimacy* (2d ed., New York, 1892), G. Brigida, *Del diritto gli alimenti del figlio della unione adulterina o incestuosa, in rapporto al genitore secondo il diritto civile italiano* (Naples, 1895), Paul Lafat, *La protection des enfants naturels d'après la loi du 2 juillet, 1907* (Paris, 1908), Othmar pamm, "Die Verpflegungsverhältnisse der unehelichen Kinder," in *Archiv für Sozialwissenschaft und Sozialpolitik*, vol. xxvii (Tubingen, 1908), Jean Delangre, *De la tutelle des enfants naturels* (Lille, 1909).

ILLICHPUR. See **ELLICHPUR**

ILLICIUM, il-līsh'ī-tūm (Neo-Lat., from *Lat lacere*, to allure, from *in*, in + *lacere*, to en- ce). A genus of trees and shrubs of the fam-

ily Magnoliaceae. The species are few, but very widely distributed. The most important is *Illicium anisatum*, star or Chinese anise, the fruit of which is used in medicine and as a condiment. This tree is held in high esteem by the Japanese and is planted near their temples. The star anise of commerce is now derived principally from Anam. Among the other species is *Illicium floridanum*, a shrub with dark-red flowers, a native of Alabama and western Florida, of which the leaves and capsules smell something like rosin. Similar in fragrance is *Illicium parviflorum*, another much rarer Floridian species. See **ANISE**.

ILLIGEN, él'lé'zhan', ANDRÉ (1638-70). A French buccaneer, native of Ixelles, near Brussels. From the merchant service of the Netherlands, he passed into that of the French filibuster Montbars, who had saved him from the Spaniards, and together they sacked cities and ships of the enemy. Illigen afterward worked with the famous Welsh pirate Sir Henry Morgan, with whom he cooperated during some of the latter's noted expeditions against the possessions of Spain in the West Indies and South America.

ILLIMANI, élyé-má'né. A volcano in the Bolivian Andes, South America, situated about 25 miles southeast of the city of La Paz (Map Bolivia, D 7). It is surmounted by four peaks, of which one, Condor Blanco, is over 20,800 feet high. It is covered with perpetual snow above 15,000 feet, whence its name, signifying 'snow mountain'. There is a lake in the mountain mass 15,900 feet above sea level, and glaciers on the north side at an altitude of 16,350 feet. The first ascent to the summit of one of its peaks was made in 1877 by Wiener, Grumbkow, and Ocampo, and the highest peak was ascended by Sir Martin Conway in 1898.

ILLINGTON, MARGARET (1881-). An American actress, born at Bloomington, Ill. She studied at Illinois Wesleyan University and at the Chicago Musical College. Her début was made in *The Pride of Jennico* in New York City in 1900. In 1903 she took the leading part in *The Japanese Nightingale*; and thereafter she played important rôles in various notable plays, including *The Two Orphans* (1904), *Mrs. Lefingwell's Boots* (1905), *The Lion and the Mouse*, in London (1906), *His House in Order* (1906), and *The Thief* (1907), and she starred in *Kindling* (1911-12), *Within the Law* (1913-14), and *The Lie*, by Henry Arthur Jones (1914).

ILLINOIS, il'lī-noi' or -noiz' (Amer Indian, *Illm*, men). A group of North American Indian tribes belonging to the great Algonquian linguistic family (see **ALGONQUIAN STOCK**) and originally occupying the State that received their name. La Salle speaks of Lake Michigan as Lac des Illinois. Some of the separate tribes in this group were the Cahokias, after whom the gigantic pyramidal mound opposite St. Louis was named, Kaskaskia, Michigami, Moingwena, Peoria, and Tamaroa. Most of them have left the record of their existence in place names here and there about the State.

The Illinois came early into relations with La Salle (1670-82) and the French traders. Through the influence of the Trappist monks these tribes were held loyal to the French in their wars with the neighboring tribes and afterward with the English. At the close of the Revolution the United States had great difficulty in subduing them. There are now but 128 individ-

uals passing as Peorias, residing in Oklahoma. Very little is known of their culture, but it seems to have resembled that of the Miami and Shawano.

ILLINOIS, known as the "Prairie State." A north-central State of the United States. Its location has influenced greatly its settlement and development. 1 It is between the Great Lakes and the Mississippi and Ohio rivers and has a length of 385 miles, extending from the latitude of Lynn, Mass., to that of Newport News, Va. Since American expansion has been chiefly westward, along such highways as the Great Lakes and the Ohio River, the State drew its early population from widely separated areas. Later, the waterways mentioned afforded access both to southern and eastern markets. 2 More than nine-tenths of the State is within the glaciated area. To this fact Illinois is indebted for most of its fertile soil and for the gentle topography which has made easy the building of wagon roads and railroads and the use of labor-saving farm machinery. 3 Illinois is near the centre of the humid region of the United States and has a climate highly favorable for the growth of many crops and for most human activities. These matters are far more significant than the mere fact that Illinois lies between lat 36° 59' and 42° 30' N and long 87° 35' and 91° 40' W. Area, 56,665 square miles.

Topography. Much of the State has a nearly level surface. The general slope is from northeast to south-southwest. The highest point, Charles Mound on the Wisconsin boundary, is 1257 feet above sea level, while the lowest, less than 300 feet above the sea, is at the junction of the Mississippi and Ohio rivers. The northern quarter or so has an elevation of above 700 feet, the central half between 500 and 700 feet, and the southern quarter below 500. Topographically Illinois may be divided into (1) the drift plains, whose surfaces are at about the average altitude of the State, (2) the moraine hills and ridges, which rise above the prevailing level, (3) the uplands of the unglaciated areas, in the northwest and the south, and (4) the valley floors of the larger rivers, which form lowlands distinctly below the general level.

Hydrography. Most of the large rivers of the surrounding States flow towards Illinois, a fact formerly of much economic significance. Most of the rivers rising in the State flow from moraine ridges and are tributary to the Wabash, Ohio, or Mississippi. The most important river within the State is the Illinois. It was followed by the first white men who crossed the State, it was an important highway for the fur trader, it guided thousands of emigrants into central Illinois, and it formed one of the greater commercial routes of the interior during the period of steamboat navigation. To-day the counties bordering the Illinois River and its continuation, the Illinois-Michigan Canal, contain about half the people of the State. The deposits of a tributary stream, acting as a dam, have produced the wide expansion of the middle Illinois River, known as Lake Peoria. Among the other larger rivers are the Rock, Kaskaskia, Big Muddy, and Embarras, once important as highways, they long since were abandoned by trade. Some of the rivers of Illinois are acquiring new importance in connection with the development of hydroelectric power.

Climate. The climate is little modified either by contrasts of topography or by the influence

of the Great Lakes. The State lies across the paths of many cyclonic storms, which bring it frequent and at times sudden changes of weather. Cold waves invade all parts, and high temperatures prevail in all sections for longer or shorter intervals almost every summer. The mean temperature for July ranges from 70° F in the extreme northeast to about 80° F at Cairo. The mean for January ranges from 20° F and less in the northern counties (except near Lake Michigan) to 30° F and more in the southern counties. The mean annual rainfall ranges from 43 inches at the south end of the State to 33 inches at the north end, the average for the State is about 38 inches. The precipitation is fairly well distributed in time, though severe droughts may be experienced at any time in any part. The growing season, the period between the latest and the earliest killing frosts, is about six months long at the north and about seven months long at the south.

Soils. The soils of Illinois vary greatly in fertility.

With some local exceptions, those of the younger drift sheets (in the north and northeast) are rich in mineral plant foods, for they constitute an intimate mixture of materials ground up by the ancient glaciers from many kinds of rock, and in most places they have not been injured seriously by washing and leaching. Over large areas the surface is nearly free from stones, owing to a deposit of loess or loess-like silt. The soils of the oldest drift sheet (towards the south end of the State) are of relatively inferior quality. Extensive tile drainage has been necessary on the flatish, intermoraine plains.

In the unglaciated sections the residual soils of the uplands are, as a rule, less fertile and, especially on the hill slopes, less thick than the alluvial soils of the larger valley bottoms.

Mining. No iron ore is produced in Illinois. The furnaces, located chiefly in the northern part, convenient to lake transportation, receive their supplies of ore from Lake Superior. The prominence of the State in mining is due to its large production of coal, in which Illinois is exceeded only by Pennsylvania and West Virginia. The value of coal produced considerably exceeds 50 per cent of its total mineral production. There are 102 counties in the State, and coal is mined in 50 of these. The counties credited with the largest production are in the southern and southwestern part, in the neighborhood of the city of St. Louis, although in the northern part, where the mines are close to Chicago markets, large mining operations are carried on. The reason for the larger production in the southern part of the State appears to be that the beds in that section are thicker than those worked in the northern part, and moreover the Chicago market is one which to a considerable extent is supplied by West Virginia coal, and most of the coal used in the manufacture of coke in Chicago and Joliet is from West Virginia mines. The total coal production in 1913 was 61,618,744 tons, valued at \$70,313,605, the highest production in the coal-mining history of the State, in spite of the fact that the industry has been seriously hampered in recent years by labor difficulties. The total number of men employed in the coal mines of Illinois in 1913 was 79,529, working for an average of 189 days. Nearly half the coal is mined by machines. The State is an important producer of coke, 1,859,553 short tons, valued at \$8,593,581 in 1913. At least 80 per

cent of the raw coal used in the coke ovens comes from West Virginia.

Petroleum is second in importance among the mineral products, the State ranking third in 1913 as a producer of this mineral, being the most important State in this respect east of the Mississippi River. The production in 1913 was 23,893,899 barrels, valued at \$30,971,910. Prior to 1905 the oil production of Illinois was measured by a few hundred barrels, but in the last six months of that year, owing to some developments near Casey, Clark Co., the production rose to about 180,000 barrels. Even with this there was little thought of the importance which the State would achieve as a petroleum producer. Within the three years of the extension of the oil territory, however, the production increased to over 33,000,000 barrels, and since that time it has averaged 30,000,000 barrels yearly. A decrease in the production in 1911, 1912, and 1913 gave rise to some apprehension that the standing of the State as a producer of petroleum would be short-lived. In the value of manufactured clay products, Illinois ranks fourth, with a total in 1913 of \$15,195,874. Raw material for the manufacture of these products is present everywhere. The clay-working industry is in a large measure concentrated in the vicinity of Chicago. The principal clay products are building brick, vitrified brick, architectural terra cotta, drain tile, and pottery. Other important mineral industries are cement, 4,734,540 barrels, valued in 1913 at \$4,784,696, sand and gravel, in 1913, 7,992,140 short tons, valued at \$2,070,491, stone production, in 1913, valued at \$4,140,953, and sulphuric-acid production, in 1913, 195,145 short tons, valued at \$1,303,986. The cement plants are located chiefly in the north, convenient to the Chicago market and to water transportation on Lake Michigan. The principal quarry product is limestone. Illinois ranks first among the States in the production of fluor spar, mined at Rosiclare in the south. It is second in the production of tripoli, a residual siliceous material used as a basis for abrasives and for filtration. Other mineral products are asphalt, glass sand and other sands, gravel, lead, lime, mineral paints, mineral waters, silver, and zinc. The output of pig iron in 1913 was 2,892,263 long tons, valued at \$45,796,986. In addition to pig iron, ferro-alloys, amounting in total value to over \$800,000 yearly, are made. The total value of the mineral production in 1913 was \$131,825,221.

Agriculture. A very large proportion of the total land area of Illinois is topographically suited to the best forms of agricultural occupation, while the great variety of soil and the favorable location with regard to transportation and markets have made possible a diversified and profitable agriculture. Of the entire land area, over nine-tenths is in farms, and the counties in the central and northern parts have in the greater number of cases from 90 to 95 per cent of their land in farms, and a comparatively large number have over 95 per cent. The southern counties show in frequent instances from 80 to 90 per cent of their total area in farms. The total number of all farms in the State in 1910 was 251,872. The average per farm in the same year was 129.1 acres. In 1910 the value of farm property was \$3,905,321,075, the average value of all property per farm was \$15,505, and the average value of land per acre was \$95.02.

Of the total number of farms in 1910, 147,-

493 were operated by owners and managers and 104,379 by tenants. In 1880 about 31 per cent of the farms were operated by tenants. This proportion increased during the following decades until 1910, when about 41 per cent of the farms were thus operated. Of these almost 15 per cent were operated by cash tenants and about 26 per cent by share tenants and cash-share tenants.

Of the total number of owned farms in 1910 (145,107), 86,713 were free from mortgage. The average debt per farm in the same year was \$3135, and the average equity per farm was \$9179.

Over six-sevenths of the farmers in 1910 were native whites, and nearly one-seventh were foreign-born whites. The native white farmers numbered 217,053, the foreign-born farmers 33,394, and the negro and other nonwhite farmers, 1425. Of the foreign-born white farmers, over half were born in Germany.

The table below gives the most important facts relating to the principal crops in 1914. The figures are according to estimates of the United States Department of Agriculture.

CROPS	Acreage	Prod bu	Value
Corn	10,346,000	300,034,000	\$183,021,000
Wheat	2,500,000	48,250,000	46,712,000
Oats	4,300,000	125,990,000	55,436,000
Barley	55,000	1,622,000	989,000
Rye	49,000	784,000	666,000
Potatoes	124,000	7,440,000	4,538,000
Hay	2,250,000	* 1,912,000	27,533,000
Tobacco	600	† 468,000	56,000

* Tons

† Pounds

While the production of corn is very general, the greatest acreages are in the central counties. Oats are grown throughout the State, though in very small amounts in the southern counties. Wheat is grown principally in the west and south, and showed very great increase in the western counties during the decade 1899-1909, but decreases in the acreage of this crop are found in most of the southern and for a few of the northern counties. The hay and forage acreage is very evenly distributed. Alfalfa has made little headway, although grown in almost every county. There is a considerable production of sugar beets. In 1909 the production was 14,981 pounds, with a value of \$77,732. Sorghum cane, valued at \$496,114, was produced in the same year. From this there were made 977,238 gallons of sirup, valued at \$400,569. In 1910 there were 15,033,743 fruit trees or vines of bearing age. There were produced, in 1909, 4,939,211 bushels of orchard fruits, valued at \$3,857,743. The most important of these is apples, of which 3,093,321 bushels, valued at \$2,111,866, were produced in that year. Second in importance are peaches and nectarines, the production of which in 1909 was 1,222,570 bushels, valued at \$999,516. Then follow cherries, plums, and quinces. Most parts of the State are very favorable for the production of grapes, of which the total production in 1909 was 16,532,785 pounds, valued at \$426,468.

Of small fruits there were produced, in 1909, 13,602,676 quarts, valued at \$1,109,747. The most important of these was strawberries, of which there were produced 8,031,824 quarts, valued at \$613,917. Other important small fruits are blackberries and dewberries, raspberries and

loganberries, gooseberries, currants, and cranberries. Sweet potatoes are an important crop. In 1909 the acreage of these was 10,568, the production 1,050,932 bushels, and the value \$506,760. Broom corn is also one of the most important of the minor crops, the acreage harvested in 1909 was 38,452, the production 19,309,425 pounds, and the value \$1,457,172.

Live Stock.—On Jan. 1, 1914, according to the estimates of the United States Department of Agriculture, there were in the State 2,233,000 cattle, valued at \$102,843,000, 1,497,000 horses, valued at \$169,161,000, 148,000 mules, valued at \$17,908,000, 4,358,000 swine, valued at \$47,066,000, 984,000 sheep, valued at \$4,920,000. The total number of poultry of all kinds in 1910 was 21,409,835, with a value of \$11,696,650.

Dairy Products.—In 1909, 320,440,399 gallons of milk were produced. The butter made amounted to 46,609,992 pounds, and the cheese, 81,918. Butter was valued at \$10,493,217, and cheese at \$8396. The milk sold was valued at \$18,314,172.

Forest Products. There were 54,618 farms in the State in 1909 which reported forest products. These included firewood, fencing material, logs, railroad ties, telegraph and telephone poles, materials for barrels, bark, and naval stores, with a total value of \$3,325,250. In 1909 there were 814 saw mills in the State, but the greater part of the total value of products was from the planing mills, which include establishments making sash, doors, blinds, stair work, moldings, and interior woodwork. The total value of products of these industries in 1909 was \$44,952,000.

Manufactures. Illinois is the most important manufacturing State west of the Alleghenies. It has excellent railroad facilities and has the advantages of cheap water transportation afforded by the Mississippi and its tributaries and by the Great Lakes. (See *Transportation*, below.) In 1910 there were 32 incorporated places with populations of 10,000 or over. These contained 52.3 per cent of the total population, and in 1909 had 83.1 per cent of the total value of its manufactures. The growth of the industry is shown by the fact that in 1849 there was an average of 11,559 wage earners, representing 1.4 per cent of the total population. In 1879 this had increased to an average of 144,727 wage earners, or 4.7 per cent of the total, and in 1909 to an average of 465,764 wage earners, or 8.3 per cent of the total population. The gross value of products per capita of the total population increased from \$19.42 in 1849 to \$340.38 in 1909, and the proportion which the manufactures of the State represented of the total value of the products of manufacturing industries in the United States increased from 1.6 per cent in 1849 to 9.3 per cent in 1909. In the value of its manufactures Illinois ranked fifteenth in 1849 and third in 1909. Details in regard to the most important manufactures of the State in 1904 and 1909 are shown in the table herewith. On account of the limitations of space only those industries whose product in 1909 had a value of \$10,000,000 or more are included in this table.

In 1909 there were 95 industries, or industry groups, the products of which were valued at more than \$500,000 each. These include 8 with products exceeding \$50,000,000, 8 with products between \$25,000,000 and \$50,000,000 in value, 15 with products between \$10,000,000 and \$25,000,000 in value, 17 with products between \$5,

000,000 and \$10,000,000 in value, 34 with products between \$1,000,000 and \$5,000,000 in value, and 13 with products between \$500,000 and \$1,000,000. The most important single industry in value of products is that connected with slaughtering and meat packing. In this industry Illinois held first place—the value of the output in 1909 (\$389,595,000) forming 28.4 per cent of the total for the industry in the United States. Second in value of products are those related to foundries and machine shops. Then follow the men's clothing industries and printing and publishing. Most of the clothing establishments are located in Chicago. In printing and publishing industries Illinois ranks second only to New York, and the value of the products in 1909 formed 11.8 per cent of the total for the United States. The products of iron and steel, steel works and rolling mills, ranked fifth, and the manufacture of agricultural implements sixth, in point of value. In 1909 Illinois contributed \$38,300,000, or 9.8 per cent of the total value of products for all blast furnaces in the country. The manufacture of wire is a very important branch of the iron and steel industry. Illinois has always been the leading State in the manufacture of agricultural implements and in 1909 manufactured 39.1 per cent of the total value of these products for the United States. The growth in the manufacture of automobiles from 1904 to 1909 is remarkable. The total number of persons engaged in manufactures during 1909 was 561,044, of whom 465,764 were wage earners. In all the manufacturing industries combined, 82.2 per cent of the average number in 1909 were males 16 years of age and over, 16.3 per cent were females 16 years of age and over, and 1.5 per cent were children under the age of 16. The men's clothing industry employed more women than any other industry, and together with women's clothing and men's furnishings-goods industries employed nearly one-third of the total number of female wage earners 16 years of age and over. Other industries employing large numbers of female wage earners are printing and publishing, slaughtering and meat packing, and the manufacture of clocks and watches, millinery and lace goods, electrical machinery, tobacco products, and fancy and paper goods. Of the wage earners under 16 years of age, the larger number were employed in the men's clothing industry, printing and publishing, the manufacture of fancy and paper boxes, boot and shoe industry, the manufacture of pianos and organs, the confectionery industry, and in the foundry and machine shops.

In 1909, 69.5 per cent of the establishments were located in cities having a population of 10,000 and over. Of the value of products, 83.1 per cent was produced in incorporated places having over 10,000 inhabitants. Of the total number of wage earners employed in 1909, 63.1 per cent were in Chicago, and 66.8 per cent of the total value of products was produced in that city. For details in regard to manufacturing industries of Chicago, see CHICAGO, and for industries relating to other cities in Illinois, see separate titles.

In all industries 28.9 per cent were under corporate ownership in 1909. Establishments owned by corporations produced 85.8 per cent of the total value of products in 1909, establishments under firm ownership represented only 16.5 per cent of the total number in 1909.

The total figures for manufactures presented

COMPARATIVE SUMMARY FOR 1909 AND 1904

THE STATE—ALL INDUSTRIES COMBINED AND SELECTED INDUSTRIES

INDUSTRY	Cen- sus	Num- ber of estab- lish- ments	PERSONS ENGAGED IN INDUSTRY				Capital	Wages	Value of products	Value added by manu- facture
			Total	Pro- pri- etors and firm mem- bers	Salar- ied em- ploy- ees	Wage earners (aver- age num- ber)				
All industries	1909	18,026	561,044	17,357	77,923	465,764	\$1,548,171	\$273,319	\$1,919,277	\$758,350
	1904	14,921	447,947	13,990	54,521	379,436	975,845	208,405	1,410,342	570,285

* Excluding statistics for two establishments, to avoid disclosure of individual operations

herewith do not include the statistics for an establishment operated by the Federal government—the arsenal at Rock Island. In 1909 this plant employed an average of 1698 wage earners, and the value of its products, which consisted of infantry, cavalry, and artillery equipment, was \$3,114,338.

Transportation. Many trunk lines, both between the East and West and between the North and South, enter or pass through Illinois, and nearly every county is traversed by one or more railroads running into Chicago or St. Louis. On Jan. 30, 1909, there were 150 railroad companies having lines through the State. In that year Illinois had approximately 12,000 miles of main track of steam railroad, an average of over 21 miles for every 100 square miles of territory, and also 2700 miles of electric railroads. In addition to these ample railroad facilities the State has the advantage of cheap water transportation afforded by the Mississippi River and its navigable tributaries and by the Great Lakes. The total mileage of main lines on June 30, 1913, was 12,168. There were in addition 3024 miles of additional main tracks, 563 miles of industrial tracks, and 7496 miles of yard tracks and sidings, or a total of 23,252 miles. There were in the same year 1544 miles of surface and elevated electric railways. This includes only main lines. There were also 213 miles of additional main tracks, 33 miles of industrial tracks, and 139 miles of yard tracks and sidings, making a total electric mileage of 930. In railway mileage Illinois exceeds every other State except Texas. In 1907 a canal was completed by the United States government from Hennepin to Rock River. This, together with the Illinois and Michigan Canal at La Salle, completed in 1848, provides an improved waterway from Chicago to the Mississippi River. In 1908 a bond issue to the amount of \$20,000,000 was authorized to provide for making a canal as far as the city of Utica, on the Illinois River, and for connecting this with the Chicago Sanitary District at Joliet. (For an account of the transportation facilities of Chicago, see CHICAGO.) A railway and warehouse commission has general charge of the railways with authority to fix freight and passenger rates. This commission was established in 1871 and is the oldest commission of the sort in the United States. The laws governing this commission were amended in 1911, and its powers were increased. The United States government is making improvements in several rivers.

Banks. There were in Illinois, on June 4, 1913, 459 national banks, with a capital of \$75,777,000 and deposits of \$863,142,000, 697 State banks, with deposits subject to check amounting to \$89,009,781 and savings deposits of \$76,289,250, 53 loan and trust companies, with deposits subject to check amounting to \$85,329,102 and savings deposits of \$216,644,432, and 235 private banks with deposits subject to check of \$17,513,737 and savings deposits of \$9,139,065.

Finance. Receipts from all sources and disbursements from Oct. 1, 1912, to Sept. 30, 1914, amounted to \$39,708,784 and \$32,952,862 respectively. There was a balance at the end of the period of \$12,255,132. The chief sources of revenue are State taxes, the inheritance tax, the Illinois Central Railroad, and fees collected by the different State departments. The chief expenditures are for the National Guard, the University of Illinois, normal schools, charitable and penal institutions, the salaries of officers

and employees, and members of the Legislature. The bonded debt of the State was \$17,500.

Government. The State has been governed under three constitutions. The first became operative when Illinois was admitted to the Union in 1818, the second was ratified by the people in 1848, and the third and present constitution in 1870. It has been several times amended since its adoption. A convention for amending or revising the constitution may be called upon the concurrence of a two-thirds majority of each House submitting the question of whether such convention shall be held to the electors, who shall decide, by a majority vote, whether a convention shall be held. If the proposal is accepted by the electors the General Assembly shall at the next session provide for a convention to consist of double the number of members in the Senate. This convention must within three months after the election prepare such revision, alteration, or amendments of the constitution as shall be deemed necessary. These amendments are then submitted to the electors for their ratification or rejection at an election appointed by the convention for that purpose, not less than two nor more than six months after the adjournment. Amendments may also be proposed in either House of the General Assembly, and if they shall be voted for by two-thirds of all the members elected to each of the two Houses, such proposed amendments shall be submitted to the electors at the next election. The General Assembly may not propose amendments to more than one article of the constitution at the same session nor to the same article more than once in four years.

Legislative.—Legislative power is vested in a General Assembly, which consists of a Senate and House of Representatives. Elections for members are held biennially on the first Tuesday after the first Monday in November. A senator must be 25 years of age and a representative 21 years of age. The State is divided into 51 senatorial districts, each of which elects one senator, whose term of office is four years. The General Assembly apportions the State every 10 years in accordance with the results of the Federal census. The result is divided by 51, and the quotient obtained is the ratio of representation in the Senate. Each senatorial district elects three representatives to serve for a term of two years. In all elections of representatives each qualified voter may cast as many votes for one candidate as there are representatives to be elected, or may distribute the same, or equal parts thereof, among the candidates, as he shall see fit, and the candidates highest in number of votes shall be declared elected. This provision of the constitution is designed to secure minority representation. The legislators receive \$2000 each for the two years for which they are elected. The General Assembly may not pass local or special laws for granting divorces, regulating county or township affairs, regulating the practice in courts of impeachment, regulating the practice in courts of justice, or granting to any corporation, association, or individual any special or exclusive privilege, immunity, or franchise. The House of Representatives has the sole power of impeachment, and all impeachments are tried by the Senate.

Executive.—The executive department of the government consists of a Governor, Lieutenant Governor, Secretary of State, Auditor of Public Accounts, Treasurer, Superintendent of Public

Instruction, and Attorney-General These, with the exception of the Treasurer, hold office for four years, from the second Monday of January next after election. They must, except the Lieutenant Governor, reside at the seat of government during their term of office. The Treasurer holds office for two years and until his successor is elected and qualified. He is ineligible to the office for two years next after the end of the term for which he was elected. No person is eligible to the office of Governor or Lieutenant Governor who has not attained the age of 30 years and who has not been for the five years immediately preceding his election a citizen of the State. The Governor has the usual veto power over legislative measures. The Lieutenant Governor is President of the Senate.

Judiciary—Judicial power is vested in a supreme court, circuit courts, appellate courts, county courts, probate courts, and such courts as may be created by law in and for cities and incorporated towns. The supreme court consists of seven judges, one of whom shall be chief justice. Four of these constitute a quorum, and a concurrence of four is necessary to every decision. The State is divided into seven districts, in each of which a judge of the supreme court is elected for a term of nine years. The State, exclusive of Cook County and other counties having a population of 100,000 or over, is divided into judicial circuits. For each of these three judges are elected for a term of six years. The circuit courts have original jurisdiction of all cases in law and equity and such appellate jurisdiction as is or may be provided by law. They are required to hold two or more terms each year in every county. Inferior appellate courts, of uniform organization and jurisdiction, may be created in districts formed for that purpose. In these courts such appeals and writs of error as the General Assembly may provide may be prosecuted from circuit and other courts. Appellate courts are held by such number of judges of the circuit courts and at such times and places and in such manner as may be provided by law. One judge is elected for each county. County courts are courts of record and have original jurisdiction in all matters of probate, settlement of estates of deceased persons, and such other jurisdiction as may be provided by general law. Cook County, which comprises the city of Chicago, forms one judicial district. The courts of Cook County consist of 14 judges of the Circuit Court of Cook County, one of whom is chief justice, and 18 judges of the superior court of Cook County. These are all elected for six years.

Suffrage and Elections—Persons who have resided in the State for one year, in the county 90 days, and in the election district 30 days immediately preceding any election therein, and those who were electors in the State on the first day of April, 1848, or obtained a certificate of naturalization before any court of record in the State prior to the first day of January, 1870, or those who are male citizens of the United States above the age of 21 years, are qualified voters. The Legislature of 1913 passed a measure giving to all women who are citizens of the United States and 21 years old the right to vote for nominees for all offices created by statute. Its limitations prevent women from voting for governor, United States senators, representatives in Congress, members of the Legislature, nearly all judges, and limits the voting privilege to the presidential electors, university trustees, and

various county, township, and municipal officers. This measure was upheld as valid by the Supreme Court of the State in 1914. The Legislature in special session in 1910 passed acts providing for primary elections. Three primary laws passed prior to that year had been declared unconstitutional by the State court. The first of these measures, passed in 1910, was a general act to provide for the holding of primary elections by political parties, and the second provided for the holding of primary elections for the nomination of members of the General Assembly and the election of senatorial committeemen. By provisions of the general act a political party which at the general election for State and county officers next preceding a primary polled more than 2 per cent of the entire vote cast is declared to be a political party within the State and may nominate all candidates provided for in the act. Primary elections are held for the nomination of all candidates for State, congressional, senatorial, county, town, city, or village officers, and for the election of precinct, ward, and State central committeemen, and delegates and alternate delegates to national nominating conventions. The act does not apply to nominations of candidates for election of President and Vice President of the United States, trustees of the State University, school or township officers. All conventions are held on the first Friday after the first Monday next succeeding the September primary. The convention of each political party has power to make nominations for presidential electors and trustees of the University of Illinois. It may also adopt a party platform.

The primary to nominate candidates for State, congressional, senatorial, and county officers to be elected on the first Tuesday after the first Monday in November is held on the first Wednesday after the second Tuesday in September. The Legislature of 1913 amended the measures relating to elections so as to bring them into conformation with the Seventeenth Amendment of the United States Constitution, providing for the direct election of senators. In every year in which a President of the United States is to be elected, a primary is held on the second Tuesday in April to nominate delegates and alternate delegates to national nominating conventions and for the purpose of securing an expression of the sentiment and will of the voters in respect to candidates for the nomination for President. This is the presidential primary and provides that the vote of the State at large is to be considered advisory to delegates at large to conventions, and the vote of each congressional district is considered to be advisory to delegates of the district. Candidates for United States senator are included as "State officers" and are nominated at the September primary in the same manner as other State officers.

Local and Municipal Government—The General Assembly provides for township organization under which any county may organize whenever a majority of the legal voters voting at any general election shall so determine. Each county has a board of commissioners. The county affairs of Cook County, which includes Chicago, are managed by a board of commissioners of 15 persons, 10 of whom are elected from the city of Chicago and 5 persons from outside that city. The officials include a county judge, county clerk, sheriff, and treasurer. The Legislature of 1910 passed a measure providing for a commission

form of government in towns and cities, by the terms of which all cities and villages not exceeding 200,000 in population have the power to adopt a commission form of government. Whenever the electors of such city or village equal in number to one-tenth of the votes cast for all candidates for mayor or president of the board of trustees at the last preceding election shall petition the judge of the circuit court of the county to submit to a vote of the electors of the city or village the proposition as to whether it shall adopt and become entitled to the provisions of the act, it is the duty of the judge of the court to submit such a proposition at a special city or village election to be held within 60 days. The measure includes provisions for the recall of elective officers and for the initiative and referendum. By the provisions of the general election law, on a written petition signed by 25 per cent of the registered voters of any incorporated town, village, city, township, county, or school district, or 10 per cent of the registered voters of the State, it shall be the duty of the proper election officers in each case to submit any questions of public policy so petitioned for to the electors of such incorporated towns, villages, etc., at any general or special election named in the petition. Not more than three propositions shall be submitted at the same election, and these propositions must be submitted in the order of their filing.

Other Constitutional and Statutory Provisions—No corporation may be created by special laws, or its charter extended, changed, or amended, except those for charitable, educational, penal, or reformatory purposes. It is unlawful for commissioners of any penitentiary or other reformatory institutions to let by contract to any person or persons or corporations the labor of any convict confined within the institutions. There is a pure-food law conforming in its chief features to the national law, administered under the supervision of the State Food Commissioner. There is a stringent workmen's compensation law, applying to certain dangerous industries only. Physicians are required to report cases of occupational diseases, and employers must arrange for the examination by a licensed physician, once every calendar month, of all employees in dangerous processes likely to result in such diseases. A State mining board composed of five members has charge of the administration of the coal-mining laws. The Legislature of 1913 passed a measure providing for mothers' pensions and for the municipal ownership of public utilities. The State is under a system of local option for the control of liquor traffic. At the end of 1913 the following cities with a population of 5000 or more were under "no license": Champaign, Evanston, Jacksonville, Oak Park, Paris, Rockford, Urbana, and Zion City. The proportion of the population under "no license" on that date was 33 per cent. The local-option law, which was enacted in 1907, provides for a vote on the liquor question in townships, villages, and cities. Drinking and drunkenness on railroad trains and interurban cars are prohibited. The Legislature of 1913 passed a 4-mile dry-zone bill which makes it impossible for saloons to be located within 4 miles of the State University at Champaign and Urbana.

Militia. The total number of males of militia age in 1910 was 1,330,556. The organization consists of a first, second, and third brigade of infantry, the first regiment of cavalry, the first

battalion of field artillery, a company of engineers, a company of signal troops, and a company of sanitary troops. There are five regiments of 12 companies each, one regiment of 12 companies, one machine-gun platoon, and two regiments of 11 companies each. The cavalry regiment consists of nine troops, and the field artillery consists of one battalion and three batteries. The total number of enlisted men on Jan. 1, 1913, was 5408. The officers numbered 506.

Population. The population by decades has been as follows: 1810, 12,282; 1820, 55,211; 1830, 157,445; 1840, 476,183; 1850, 851,470; 1860, 1,711,951; 1870, 2,539,891; 1880, 3,077,871; 1890, 3,816,351; 1900, 4,821,550; 1910, 5,638,591. The estimated population on July 1, 1914, was 5,986,781. The population per square mile in 1910 was 100.6. In 1910 the population in places of 2500 or more was 3,476,929, or 61.7 per cent. The rural population in 1910 was 2,161,662. The white population in 1910 numbered 5,526,962, and the negroes numbered 109,049. The whites of native parentage in 1910 numbered 2,600,555. The native whites of foreign or mixed parentage numbered 1,723,847. The foreign-born whites numbered 1,202,560. Germans are most numerous among both the foreign-born whites and native whites of foreign parentage. The State was divided by sex in 1910 between 2,911,674 males and 2,726,917 females. The males of voting age numbered 1,743,182.

In 1910 there were 12 cities with a population of 25,000 or over. The populations of these in 1910 were as follows: Chicago, 2,185,283; Peoria, 66,950; East St. Louis, 58,547; Springfield, 51,678; Rockford, 45,401; Quincy, 36,587; Joliet, 34,670; Decatur, 31,140; Aurora, 29,807; Danville, 27,871; Elgin, 25,976; Bloomington, 25,768. The estimated population of Chicago on July 1, 1914, was 2,393,325.

Religion. Estimated upon the reported number of Church communicants, the Methodists about equal the Roman Catholics in their adherents. The Baptists, Disciples of Christ, Presbyterians, German Evangelicals, Congregationalists, Lutherans (General Council), and Protestant Episcopalians follow in importance in the order named.

Education. The free-school system of Illinois dates from 1855, and progress has been made in perfecting it, especially in lengthening the school year. According to the thirteenth census, the school population, ages 6 to 20, was 1,615,914, the average number in school attendance was 1,025,053, out of a total population of 10 years old or over (4,493,734), only 168,294, or 3.7 per cent, were illiterate. Illiterates among the native whites numbered only 40,486, or 1.3 per cent, and among foreign-born whites, 117,751, or 10.1 per cent. Among the negroes illiterates numbered 9713, with a percentage of 10.5. On June 30, 1913, the school population, ages 6 to 21, was, according to the report of the State Superintendent of Public Instruction, 1,582,180, the enrollment was 1,010,215. There were employed 5609 men teachers and 24,956 women teachers, making a total of 30,565 teachers. The average annual wages paid to men teachers was \$772.07 and to women teachers \$643.70. The amount expended for all school purposes in 1913 was \$37,923,943. In 1912 there were 671 high schools, in which were enrolled 71,577 secondary students, of these, 65 schools were in cities of 4000 population. There were in addition 91 private high schools and

academies The Legislature of 1911 increased the school fund from \$1,000,000 to \$2,000,000, and the Legislature of 1913 made another addition of \$1,000,000 to this fund The same Legislature passed a certificating bill which placed Illinois in the front rank in this respect A free high-school tuition act was passed at this session, as was a law permitting local school boards to levy 2 instead of 1½ per cent for operating expenses, when authorized by the people A position of high-school inspector with a salary of \$4000 a year was created Boards of education are authorized to establish and maintain classes for the deaf, dumb, and blind, and for delinquent children, the State to pay the excess cost The Legislature of 1911 authorized the boards of education in districts having more than 1000 and less than 100,000 inhabitants to establish and maintain a fund for the retirement of teachers upon an assessment basis

The normal schools are as follows Southern Illinois State Normal University at Carbondale, Eastern Illinois State Normal School at Charleston, Chicago Normal School at Chicago, Northern Illinois State Normal School at DeKalb, Western Illinois State Normal School at Macomb, and the Illinois State Normal University at Normal Summer schools are maintained at the normal schools and at many other schools There are 33 institutions of collegiate rank Of these the most important are the University of Chicago at Chicago, the University of Illinois at Champaign and Urbana, the Armour Institute of Technology at Chicago, Northwestern University at Evanston, Knox College at Galesburg, Illinois College at Jacksonville, Illinois Women's College at Jacksonville, Lake Forest College at Lake Forest, Illinois Wesleyan University at Bloomington, James Millikin University at Decatur, and Loyola and De Paul universities (both Roman Catholic) at Chicago

Charities and Corrections As a result of a campaign conducted by the State Board of Charities, a law was passed in 1905 which placed the employees of the State charitable and correctional institutions, with a few exceptions, under the State civil-service law In 1906 the system of medical administration in State institutions was completely modernized and made uniform, and a State Psychopathic Institute was established to teach physicians in the service and for carrying on research work in the treatment and causes of insanity In 1909 the Legislature passed a new charities administration law, which centralized administration of all institutions in one board, composed of five members A centralized system of inspection, criticism, and recommendation by the board, known as the Charities Commission, made up of five nonsalaried members, was also put into effect This body is in no way responsible for administration and is therefore free to criticize the executive branch of the service The inspectional and critical service is extended beyond the central Charities Commission into the several institutions in the form of a nonpaid board of visitors for each, and the service is still further extended to each county almshouse and jail in the form of county auxiliary boards—one for each county, each having three members The board of visitors and the county auxiliary boards must report to the Charities Commission This measure contains every advanced idea in the administration of public charities that up to that time had been tried successfully in other States, especially in

the treatment of the insane, and is unique among American public-charity statutes Some of the names of the institutions were changed by the new law so as to eliminate the words "insane," "feeble-minded," "asylum," from the legal nomenclature This measure went into effect on Jan. 1, 1910 The Legislature of 1911 made an appropriation for the construction of a new hospital for the insane at Chicago, for the erection of a surgical institute for crippled children, \$10,000 for the visitation and education of the adult blind in their own homes, and for the State Psychopathic Institute, which enabled it to complete its equipment and staff, which included a director, an assistant, a chemist, a pathologist, and a bacteriologist In the same year plans were completed for a new prison at Joliet to cost in the neighborhood of \$7,000,000 In 1912 all the insane in the county farms or rural communities were removed to State hospitals, and in the same year the State took over the Dunning County Hospital for the Insane with 2700 patients One division of the State Charities Commission is a bureau of criminal statistics which collects annually statistics of crime The counties are authorized to pay pensions to needy widows with dependent children There has been a juvenile-court law in existence since 1899, and this has produced excellent results, especially in Chicago (See JUVENILE COURTS) The charitable and correctional institutions include the Lincoln State School and Colony at Lincoln, the Soldiers' Orphans' Home at Normal, the Kankakee State Hospital at Kankakee, the Dunning State Hospital at Chicago, the Soldiers' Home at Quincy, the Anna State Hospital at Anna, the Jacksonville State Hospital at Jacksonville, the Elgin State Hospital at Elgin, the Chester State Hospital at Chester, the Industrial Home for the Blind at Chicago, the Eye and Ear Infirmary at Chicago, the Watertown State Hospital at Watertown, the State Training School for Girls at Geneva, the St Charles School for Boys at St Charles, the Soldiers' Widows' Home at Wilmington, and the Peoria State Hospital at Peoria The Alton State Hospital at Alton and the Colony for Epileptics were created by the Legislature of 1913 The total population of these institutions on June 30, 1913, was 19,816, and the total appropriations for the two years beginning July 1, 1913, was approximately \$13,000,000 for maintenance, improvement, and extension The correctional institutions are the State prisons at Joliet and Chester and the State Reformatory for Boys at Pontiac

History In 1673 Father Marquette ascended the Illinois River and two years later established a Jesuit mission at the Indian village of Kaskaskia La Salle entered the river in 1679, named it Illinois from the tribes inhabiting the region, and built Fort Crèvecoeur at the foot of what is now called Lake Peoria His explorations were continued by Tonty, whom he left behind in 1680 when he returned to Canada Fort St Louis on Starved Rock was built in 1682, and between 1683 and 1690 French traders established themselves at Kaskaskia, Cahokia, and other Indian villages, though the actual settlement of Kaskaskia, the oldest town in Illinois, probably did not occur before 1700 By 1751 there were six important settlements within the present limits of the State The French showed a remarkable aptitude for controlling the Indians and adapting themselves to their mode

of life Inter-marriage between French and Indians was common, and ties of friendship were established which lasted after the power of France had passed away Pontiac's rising prevented the English for two years from taking possession of the Illinois country ceded to them in 1763 In general, conditions remained unaltered after the English occupation, but many prominent French settlers fled from English rule to St Louis, Natchez, and other towns in the valley of the Mississippi In 1778-79 a force of Virginians under George Rogers Clark (qv) captured Kaskaskia and subdued the province Virginia ceded its claims to the southern part of the region in 1784, Massachusetts and Connecticut gave up their rights in the following year, and in 1787 the region became a part of the Northwest Territory Ohio was set off in 1800, Indiana in 1802, and Michigan in 1805, what remained was organized as Illinois Territory on Feb 3, 1809 The hostility of the Indians prevented rapid settlement in the north On Aug 15, 1812, the garrison at Fort Dearborn (Chicago) was massacred On Aug 18, 1818, the first constitution was adopted On December 3 Illinois was admitted into the Union with boundaries so extended to the north as to include the port of Chicago By 1805 most of the Indian titles to land within the Territory had been extinguished There ensued a period of wild land speculation, marked by stupendous frauds The early immigrants, who came chiefly from the South, brought with them a decided predilection for slavery The first Legislature passed stringent laws to protect the few slaveholders in the State, and from 1818 to 1865 a harsh code of antinegro laws, known as the Black Laws, was in force In 1824 an attempt was made to call a convention for the purpose of legalizing slavery in spite of the Ordinance of 1787, but the project was quickly and definitely defeated The murder of Elijah P Lovejoy (qv) at Alton in 1837, however, showed the persistence of a strong proslavery sentiment After 1820 the people were hurried into an unhealthy state of precarious prosperity Banks were established at Edwardsville and Shawneetown entirely on paper credit, and an elaborate system of internal improvements was begun As the northern part of the State after the Black Hawk War began to fill up with immigrants from New England and the Middle States, the process of economic development was accelerated The Illinois and Michigan Canal was begun in 1834 and was built with the proceeds of the sale of public lands granted by Congress The inception of other public improvements was followed by a panic in 1842, when the State bank suspended specie payments The people, however, recovered quickly, and in 1850 Congress made an extensive cession of public lands to aid in the construction of the Illinois Central Railroad, an enterprise which contributed greatly to the development of the State In 1840 the Mormons, who had immigrated from Missouri and founded Nauvoo, began to figure in the politics of Illinois Welcomed at first, they became in the course of a very few years obnoxious to the mass of the inhabitants Acting as a unit, under autocratic direction, they succeeded in obtaining exclusive privileges from the Legislature Their religious practices jarred with the feelings of their neighbors, they were inclined to look upon Gentiles with superciliousness, they were prosperous Bitter feelings led to hostile action in 1844, when

Joseph Smith, founder of the sect, while in prison at Carthage on the charge of treason, was murdered by a mob In the following year the Mormons left Illinois In 1858 occurred the great contest for the United States senatorship between Abraham Lincoln and Stephen A Douglas At the outbreak of the Civil War Illinois was in an extremely prosperous condition It produced three-fifths of all the grain exported to Europe and was the second State in the Union in railway mileage During the war the State readily furnished its quota of troops, sending 260,000 men into the field In peace its prosperous development continued In 1865 Chicago had become the leading live-stock market of the world and a great grain centre Legislation between 1865 and 1885 was largely concerned with corporations and especially with the railroad companies The constitution of 1870, replacing the one adopted in 1849, forbade the creation of corporations by special law A State board of railroad commissioners was created to protect the interests of the State against the railway companies, and the Legislature frequently attempted to fix a maximum for transportation and to prevent discrimination in rates Between 1872 and 1875 the farmers of Illinois participated in the widespread Granger movement of the time (See GRANGER) On Oct 8-10, 1871, a fire laid waste a large part of Chicago and rendered 100,000 people homeless The loss to the city was estimated at nearly \$300,000,000 The action of the mayor in calling in the Federal troops to preserve order during the excitement following the calamity occasioned a bitter dispute between that official and the Governor of the State, who showed himself jealous for the honor of the civil authority A general feeling of unrest found expression in 1885 and 1886 in bitter strikes and bloody riots, in Chicago there were serious riots, during which bombs, killing several people, were thrown In 1893 the Columbian Exposition was held in Chicago In 1894 a strike of the employees of the Pullman Palace Car Company developed into a general strike of railway men Traffic in Illinois was almost suspended, and in June lawlessness broke out Interference with the United States mails led to the intervention of the Federal government Chicago was occupied by the Federal troops, the leaders of the strikers were arrested on civil process and sentenced to short terms of imprisonment for contempt of court The backbone of the strike was thus broken In national politics Illinois was Democratic before 1860 In that year it cast its vote for Lincoln, and from that time it has been consistently Republican with the exception of 1892, when it voted for Grover Cleveland, and 1912, when its vote was cast for Wilson In State politics the year 1857 marks the beginning of Republican ascendancy In the latter part of the first decade of the twentieth century political interest was largely centred in efforts to change the laws relating to elections From 1907 to 1910 the Legislature was occupied in attempting to pass a primary election law which the Supreme Court of the State would allow to stand (See *Suffrage and Elections*, above) In the national election in 1908 Illinois, on account of divisions in the Republican party, was among the doubtful States, but it was carried by Taft by a vote of 629,932 to 450,810 for Bryan For Governor, Deneen, Republican, received 550,076 votes, and Stevenson, Democrat, 526,912 On account of the lack of plurality of votes by any

candidate for the United States Senate it was necessary for the Legislature when it convened in January, 1909, to elect a Senator. There were several candidates, the most prominent of whom was Albert J. Hopkins, who made a strong fight for reelection. After a deadlock which lasted from Jan. 19 to May 26, 1909, William Lorimer, a Representative in Congress at that time, was elected Senator by a coalition of Democratic and Republican votes. This ended one of the most stubborn political struggles in the history of the country. It was, however, but the beginning of an even more serious situation. Lorimer had for many years been one of the strongest figures in Illinois politics and was generally considered to be the chief Republican "boss" of Chicago. In April, 1910, a Chicago newspaper published what purported to be a confession of a Democratic member of the House, in which it was charged that Lorimer had been elected by the wholesale bribery of Democratic legislators. As a result of investigations into the facts alleged in this confession, many prominent members of the Legislature were indicted by a grand jury. On May 28, 1910, Senator Lorimer defended himself in a long speech in the Senate, in this he denounced the alleged confession as false. He asked for an investigation, and a committee was at once appointed by the Senate to make an examination into the facts alleged. On Dec. 12, 1910, a majority of the committee made a report exonerating Lorimer. A minority report was filed by Senator Beveridge, of Indiana. In this he claimed that the charges were abundantly proved. Senator Beveridge also introduced a resolution declaring Lorimer's seat vacant on account of corruption in his election. A vote was had in the Senate in March, 1911, and by 46 to 40 its members refused to unseat him. In the meantime the State Legislature had taken action, and another investigation was authorized in January, 1911. This produced new and even more startling testimony of corruption and bribery. A resolution was adopted requesting the Senate to reopen the investigation, and on June 1 the Committee on Privileges and Elections was so authorized, and a subcommittee to take testimony was appointed on June 5, 1911. Hearings on the evidence were carried on for nearly a year. On May 20, 1912, a majority of the committee reported that the hearing had produced no new evidence of value. The minority members, however, declared that the new evidence showed conclusively that Senator Lorimer had been elected through corrupt practices. A vote was taken in the Senate on July 13, 1912, and by 58 to 28 the Senators adopted a resolution declaring that corrupt methods and practices had been employed in the election of William Lorimer and that his election was therefore invalid. This vote was preceded by a remarkable debate of seven days, three of which were occupied by Mr. Lorimer himself, who spoke in his own defense. This action left the State of Illinois with but one representative in the Senate chamber.

Senator Cullom, although 84 years of age, was a candidate for reelection in 1912, opposed to Lawrence Y. Sherman, a well-known Republican lawyer. At a special session of the Legislature a presidential primary election was authorized on March 30, 1912, and at this election voters cast their ballots also for candidates for the Senate. In this election Roosevelt received 226,917 votes, Taft, 127,487, La Follette, 42,692. Champ

Clark received a plurality of the Democratic votes. For candidate for the Senate, Senator Cullom was defeated by Sherman. Governor Deneen was renominated by the Republicans, and E. F. Dunne by the Democrats. In the presidential election on Nov. 5, 1912, Wilson received 405,048 votes, Roosevelt, 386,478, Taft, 253,593, and Debs, Socialist, 81,278. For Governor, Dunne received 443,120 votes, Deneen, 318,469, Funk, Progressive, 303,401. The Democrats elected 19 out of 25 representatives to Congress. Among the prominent Congressmen defeated were Joseph G. Cannon, Speaker of the House, and William B. McKinley, who had charge of President Taft's campaign. The Legislature elected included 97 Democrats, 76 Republicans, 27 Progressives, and 4 Socialists. The balance of power for the election of United States Senator was therefore in the hands of the Progressives and Socialists. When the Legislature convened in January, 1913, there was a deadlock in the election of officers which lasted from January 1 to the last week in that month. It was ended by the election of a Speaker by a combination of Democratic and Republican votes. Another deadlock resulted from the attempt to elect two United States Senators—one to succeed Senator Cullom and the other as a successor to Senator Lorimer. A compromise was finally arranged on March 26 by which James Hamilton Lewis, Democrat, was elected for the term of six years from March 4, 1913, and Lawrence Y. Sherman, Republican, was elected for the unexpired portion of the term left vacant by the exclusion of Mr. Lorimer. The State election of 1914 centred about the choice of a United States Senator. Senator Sherman was reelected, defeating Mr. Sullivan in a close contest.

The first elections in the State in which women participated were municipal and were held in 1914. In a number of smaller cities women officials were elected, but all the women candidates for aldermen in Chicago were defeated. Local-option elections were held on the same date, and it was in the voting on this question that the influence of women voters was most potent. No-license advocates gained a number of the larger cities. By the apportionment of 1910 the State has 27 members in the national House of Representatives, prior to that year it had 25.

ILLINOIS, UNIVERSITY OF The State University of Illinois, occupying a site of 610 acres, between the cities of Urbana and Champaign, was chartered in 1867 as the Illinois Industrial University and assumed its present name in 1885. In 1870 women were admitted as students and now form about one-fifth of the whole attendance. The university comprises the colleges of liberal arts and sciences, engineering, agriculture, law, medicine, and dentistry, and the schools of library science, music, education, pharmacy, and the graduate school. The State laboratory of natural history and the United States agricultural experiment station, the engineering experiment station, the State geological and water surveys, and the State entomological office are connected with the university. The schools of pharmacy, medicine, and dentistry are situated in Chicago. The university owns valuable collections in zoology, botany, entomology, geology, and other departments. The library contains 310,000 volumes. The university holds a summer session of eight weeks, primarily for teachers. It maintains close relations with the high schools of the State through a careful system of inspection and accrediting. It has developed rapidly and is constantly engaged in scientific investigations bearing upon the interests of the State. In 1914 it had 45 buildings, 704 instructors, and about 5500 students, of whom about 800 were in attendance at the Chicago departments. At the same time its endowment amounted to \$647,000, its buildings and grounds were valued at \$3,000,000, and its annual income, mainly derived from legislative appropriations, was \$2,775,000. The General Assembly of Illinois in 1911 established a tax of one mill on the assessed valuation of the taxable property of the State to be set apart as a fund for the maintenance of the university. The president in 1914 was E J James, Ph D, LL D. Consult E E Slosson, *Great American Universities* (New York, 1910).

ILLINOIS AND MICHIGAN CANAL See CANAL

ILLINOIS COLLEGE The oldest collegiate institution of Illinois, founded in 1829 at Jacksonville, Ill., in part through the efforts of an Eastern organization known as the Yale Band. The curriculum is arranged on the "major" system, with elective courses mainly after the freshman year, and leads to the bachelor's and master's degrees. The college had, in 1913-14, 131 collegiate, 189 music, 11 art, and 60 preparatory students, and 26 instructors. At the same time the value of its grounds and buildings was

\$315,290, and its endowment \$386,700. The library contains about 14,000 volumes, with about 4000 volumes in the libraries of the literary societies. The president in 1914 was C H Rammelkamp, Ph D.

ILLINOIS INDIANS See ILLINOIS, 1

ILLINOIS RIVER The most important tributary of the upper Mississippi, traversing the State of Illinois (Map Illinois, F 4). It is formed by the junction of the Des Plaines and the Kankakee in Grundy Co., Ill., about 45 miles southwest of Chicago. It flows generally southwest, joining the Mississippi about 24 miles above the mouth of the Missouri. Its length is 500 miles and its drainage area 29,013 square miles, of which 24,726 square miles lie in Illinois and the remainder in Indiana and Wisconsin. It is broad and deep, and navigable for steamers 250 miles, to La Salle, whence a ship canal connects it with the south branch of the Chicago River (qv), thus affording uninterrupted water communication between the Great Lakes and the Mississippi. The chief cities on the river are Ottawa and Peoria.

ILLINOIS STATE NORMAL UNIVERSITY An institution for normal and higher education, founded in 1857 at Normal, Ill. The institution undertakes to prepare every sort of teacher required by the public-school system of Illinois and therefore offers a great variety of courses in accord with the statutes of the State for the certification of teachers. The programmes of study offered are for prospective country teachers, upper-grade teachers, intermediate teachers, kindergarten-primary teachers, and special teachers of music, art, manual training, domestic science, domestic art, agriculture, and commercial branches. A four-year programme is offered for high-school teachers, superintendents, and others requiring a longer preparation. The degree of bachelor of education is conferred upon students who complete the full four-year course. This is the oldest normal school in the Mississippi valley. The school is in session 48 weeks in the year. It is claimed that this school has contributed a larger number of prominent men and women to the educational forces of this generation than has any other school of like character in America. The attendance in 1914 was about 3036, and the faculty numbered about 80. The library contains about 30,000 volumes. The president in 1914 was David Feimley, LL D.

ILLINOIS WESLEYAN UNIVERSITY A Methodist Episcopal college at Bloomington, Ill. It was founded in 1850 and comprises a preparatory school, a college of letters (embodying the elective system), and schools of law, music, and oratory. The degrees conferred in course are B A, B S, LL B, and the honorary degrees D D and LL D. The total number of students enrolled in the university in 1913 was 688, of whom 235 were collegiate students. At the same time the faculty numbered 42 instructors. The library contains some 8000 volumes. The university has an endowment of \$350,000, and grounds and buildings valued at \$175,000. The president in 1914 was Theodore Kemp, D D.

ILLITERACY (from Lat. *illiteratus*, uneducated, from *in-*, not + *litteratus*, educated, from *littera*, *littera*, letter). Inability to read and write one's own language. As used in the United States census, the term is used also of those who can read but not write.

There are several methods of determining the

percentage of illiterates, and unfortunately the various nations follow different plans. Some statisticians prefer to base their estimates on the number of applicants for marriage licenses who cannot sign their names. Most of the European countries find the percentage from the examinations of the recruits for the army and navy, thus confining the test to men of a certain age. In the United States the census makes inquiry of each person and takes his or her word, there being no test of any sort. In all countries children under a certain age are not included, as it is not expected that they should know how to read and write. The age taken naturally affects the percentage. The United States does not count children under 10, Italy fixes the age at six. Naturally, the country which best enforces compulsory school attendance will show the lowest percentage.

The report of the United States Commissioner of Education for 1900 contains the following table for the different countries:

	Per cent		Per cent
Germany	0.11	Hungary	28.10
Switzerland	0.30	Greece	30.00
Scotland	3.57	Italy	38.30
Holland	4.00	Russia	61.70
France	4.90	Spain	68.10
England	5.80	Portugal	79.00
Belgium	12.80	Servia	86.00
Ireland	17.00	Rumania	89.00
Austria	23.80		

According to the census of 1910 illiterates in the United States numbered 5,516,163, or 7.7 per cent of the population 10 years of age and older. We may compare this percentage with 14.1 for France (1904), 12.7 for Belgium (1910), 17.4 for Ireland (1901), 22.6 for Austria (1900), 40.9 for Hungary (12 years and over, in 1900), 57.2 per cent for Greece (1907), 48.2 per cent for Italy (1901), 70 per cent for Russia (1907), 73.4 per cent for Portugal and 78.9 per cent for Servia (1900), 65.5 per cent for Bulgaria (1905). Methods of attaining the foregoing percentages differ so widely for the several countries that comparison is on an insecure basis. It is none the less certain that the problem of illiteracy is far from solution in southern and eastern Europe—the chief source of recent emigration to America.

Of the illiterates in the United States, 28 per cent were native whites, 30 per cent foreign-born whites, 40 per cent negroes, and 2 per cent Indians, Chinese, Japanese, etc. Illiteracy is chiefly characteristic of rural territory. 4.8 per cent of the native whites in rural territory were illiterate, 0.8 per cent in urban communities. Of the rural negro population, 40 per cent were illiterate, of the urban negro population, 17.6.

From the following table it will appear that illiteracy is largely indicative of lack of educational opportunities in earlier decades of our history. The percentage of illiteracy increases regularly with advancing years.

YEARS	Percentage of illiterates in total population in age group	Percentage of illiterates among whites in age group	Percentage of illiterates among negroes in age group
10-14	4.1	1.8	18.9
15-19	4.9	2.8	20.3
20-24	6.9	4.6	23.9
25-34	7.3	5.2	24.4
35-44	8.1	5.4	27.7
45-54	10.7	6.7	52.7
65-	14.5	9.4	74.5

There were 2,273,603 illiterate males 21 years of age and over. Of these, 617,733 were native-born whites, 788,631 foreign-born whites, and 819,135 negroes. In percentages, illiterate males 21 years and over represented 4.1 per cent of the native born, 11.9 per cent of the foreign born, 33.7 per cent of the negroes. The potential political significance of illiteracy is indicated by the following table for cities having 8 per cent and upward of illiterate males of voting age.

CITY	Per cent of illiterates in population 10 years and upward	Per cent of illiterates in male population 21 years and upward
Fall River	13.2	15.6
Birmingham	10.4	10.7
Scranton	8.9	12.2
Nashville	8.8	9.4
Atlanta	8.6	8.1
Richmond	8.2	8.6

Of the six cities in the foregoing table, the high percentage of illiteracy in Birmingham, Nashville, Atlanta, and Richmond is due to the presence of a large negro population. In the case of Fall River and Scranton it is due to the high proportion of foreign born.

Illiteracy in the five largest cities is indicated by the following table.

CITY	Per cent of illiterates in population 10 years and upward	Per cent of illiterates in male population 21 years and upward
New York	6.7	6.4
Chicago	4.5	5.1
Philadelphia	4.6	4.7
Boston	4.4	4.5
St. Louis	3.7	4.1

Cities having less than 2 per cent illiteracy in the population 10 years and over are given in the following table. It is noteworthy that all are on the Pacific coast, where the negro and low-grade foreign population is at a minimum.

CITY	Per cent of illiterates in population 10 years and upward	Per cent of illiterates in male population 21 years and upward
Seattle	1.1	1.4
Portland	1.2	1.3
Spokane	1.3	1.8
Los Angeles	1.9	2.0

The States having the lowest percentage of illiteracy in the population of 10 years and over are Iowa (1.7), Nebraska (1.9), Oregon (1.9), Washington (2.0), Kansas (2.2), Idaho (2.2), Utah (2.5), South Dakota (2.9). The States having the highest percentages are Louisiana (29.0), South Carolina (25.7), Alabama (22.9), Mississippi (22.4), Arizona (20.0), New Mexico (20.2). The high percentages in the case of Arizona and New Mexico are explained by the presence of a large Mexican population. In the other cases it is explained mainly by the large negro population. The native white population shows a percentage of illiteracy of 5 and above in Florida, Mississippi, West Virginia, Arkansas, Georgia, Virginia, Tennessee, Alabama, Kentucky, the Carolinas, Louisiana, and New Mexico.

Until recently it has been assumed that no

effective means could be devised to reduce illiteracy among the adult population, that the percentage could be lowered only through the supplanting of the older generations by the more literate younger generations. A number of experiments have shown that there is no insuperable difficulty in teaching illiterate adults to read and write. One of the most interesting of these experiments was conducted by Superintendent of Schools Mrs. Cora Wilson Stewart in Rowan Co., Ky. In night schools organized in that county one-third of the whole adult population was enrolled and a majority were redeemed from illiteracy. Equally good results have been attained among the illiterate foreign born in some of the large cities. Consult *Census of the United States* (1900 and 1910), *Annual Reports of the Commissioner of Education* (Washington), *Illiteracy in the United States* (Bulletin No. 20 of the United States Bureau of Education, Washington, 1913), reports of ministers and departments of education of various European countries. See IMMIGRATION.

ILLUMINATED DOCTOR, THE (Lat. *Doctor Illuminatus*). A title given to Raymond Lully and to Johann Tauler (qq.v.).

ILLUMINATED MANUSCRIPTS Those adorned with figures, letters, and other designs in color and gold. Such decorations are called illuminations—a term originally used in connection with book ornamentation of the later Middle Ages, but its use has been extended to the embellishment of manuscripts in general. The term *miniature* is often used indiscriminately to designate illuminations as well as minute painting on ivory or other material, but the best usage restricts it to the last-named subject. (See *MINIATURE*.) Illuminations consist chiefly of large ornate initials, marginal drawings and borders, and illustrations of figures and incidents. In the early Middle Ages the painter of the scriptoria of the monasteries was usually called the *pictor*. The Egyptian papyri of the ritualistic class, as old as the eighteenth dynasty, especially the *Book of the Dead*, are ornamented with vignettes or miniatures, attached to the chapters, either designed in black outlines or painted in primary colors in tempera. Except these papyri, no other manuscripts of antiquity were, strictly speaking, illuminated, such Greek and Roman ones of the first century as have reached the present day being written only. Pliny, indeed, mentions from Varro that authors had their portraits painted on their works, and mentions a biographical work with numerous portraits introduced, but all such have disappeared in the wreck of ages, the oldest illuminated manuscripts which have survived dating from the fourth century. St. Jerome complains of the abuse of the practice, as shown by filling up books with capital letters of preposterous size. The art of illuminating manuscripts with gold and silver letters is supposed to have been derived from Egypt, but it is remarkable that no papyrus has any gold or silver introduced into it. The artists who painted in gold, called *chrysographi*, are mentioned as early as the second century. There were, in fact from the beginning two distinct classes of illuminated manuscripts (1) those with decorative letters and (2) those with figured compositions. These were often crossed, and figures painted within and around the letters. The purely figured illustrations, similar to the larger compositions in mosaic and fresco, originated in

early Byzantine art, and the decorative letter style was a specialty of the northern races, especially Irish and Saxon. One of the oldest manuscripts of this style is the *Codex Argenteus* of Ulfilas (c. 500 A.D.), and the charter of King Edgar (966 A.D.) shows the use of these letters. The principal late Roman illustrated manuscripts are the two *Vergils* of the Vatican, the *Iliad* of the Ambrosian (Milan), and the *Roman Philocalian Calendar* at Vienna, all belonging to the fourth century or the early part of the fifth, and illustrating the last phase of the secular school. There exist also a few copies of originals of this date or earlier, such as the Terence plays at the Vatican and Bibliothèque Nationale and the *Calendar of Aratus* at Boulogne. Of Greek classic descent are the exquisite pictures in the Viennese manuscript of the medical writings of Dioscorides, not executed till 505 A.D.

Early Byzantine. In the Eastern Empire, during the fifth and sixth centuries, illuminating became one of the most important branches of Christian art and remained so until the sixteenth century. With an innate talent for color born of the Orient, the Byzantines, while retaining a free, rather classic drawing, used brighter colors and applied gold more freely than had hitherto been done. Manuscripts of the Old Testament, either as a whole or in separate books, and Gospel manuscripts were systematically searched for incidents of historic or religious importance. At first there was even a superabundance of pictures, as in the roll of Joshua at the Vatican, and, though less so, in the fifth-century codices of Genesis at Vienna and the British Museum. The normal type was given at this time by the *Rossano Gospels*, a work of the Byzantine school which was creating the new art. In the teaching of the people by pictures it is difficult to decide which branch of art gave the suggestive types for the scenes—the illuminators or the mosaicists and fresco painters. Outside of the Bible the chief work is the manuscript of Cosmas Indicopleustes at the Vatican, with its 54 pictures of the sixth century. Until the seventh century the illuminations were square or oblong pictures interrupting the text, but at that time the calligraphic style of decoration began, with its initial letters and its interweaving of human, animal, and geometric forms with the letters. Already in the famous Syriac manuscript at the Laurentian Library (Florence) this decorative sense had shown itself. It was developed by the Byzantine artists of the Iconoclastic age, who preferred ornamentation to the human figure, and by the Irish and Anglo-Saxon schools, which showed an originality and boldness in decorative design equal to their ineptitude in treating the figure.

The Irish school was essentially a native product, developed without foreign influence, in the monasteries of Ireland during the seventh century, whence it was transplanted to Scotland and England. In England the style was continued by later monks, though modified by Byzantine and later by Carolingian influences. The Irish style broke away entirely not only from all classic traditions but from all naturalism. Spirals, knots, bands, zigzags, and other geometric forms, derived largely from metal work, were interwoven often with fantastic beasts and impossible men. The colors are harmonious and rich as enamel, and in pure Irish

work no gold is used. The *Book of Deer*, the Dorbeei *Life of Columba*, the *Lindisfarne Gospels*, the *Book of Kells*, the *St Gall Gospels*, the *Wurzburg Epistles*, the *Utrecht Psalter*, are among the finest works of this school.

Carolingian. Meanwhile in the West the Benedictine monks of the sixth and seventh centuries had continued the degenerate Roman style, as in the Pentateuch of Tours, or were copying Byzantine models, as in the *Cambridge Gospels*. The prominence of Irish and Anglo-Saxon monks in the missionary and educational worlds in the eighth century throughout northern Europe made them the teachers of the Carolingian school of illuminators that sprang up in France and Germany. This school, while adopting much of the decorative scheme, including the immense and highly ornamental initial letters of the Irish, added the use of sacred compositions with the human figure, largely from Latin or Byzantine models. Rich architectural details are used to frame the scenes, and large single figures of Christ, the Emperor, the Evangelists, etc., prevail. The backgrounds are not gilt, but plain or broken up by accessories. The Gospel book of Charlemagne from Soissons (Bibliothèque Nationale, Paris) is dated 781 and is one of the earliest and finest works of the school. It had several branches. In France were (1) the Franco-Saxon branch, extending from Paris to the Rhine, of which over 30 examples remain, including the Gospels at Arras, the *Psalter* at Vienna, and the above Gospels from Soissons, (2) the branch of Tours, founded by Alcuin, illustrated by Bibles and Gospels, in the British Museum, belonging to Alcuin, Charles the Bald, and Lothair, (3) the branch of Orléans, with Bibles at the Bibliothèque Nationale and Le Puy. In Germany were (1) the branch at Metz, to which the Sacramentary of Drogo belongs, and (2) that at St Gall, which has specimens in the Munich Library. In these Carolingian works the colored outline drawing was brilliant rather than solid, the figures clumsy and inclined to overaction. But the general effect was of splendor and originality.

Romanesque. The true continuators of the Carolingian style in the Romanesque period were the German illuminators of the time of the Otthos and the Henrys, who tempered the earlier exaggerations of movement and size through contact with Byzantine art. Both the Rhenish and the Saxon schools, especially the latter, have left many works executed for these emperors, now preserved at Bamberg, Munich, Trier, Paris, etc., especially Gospel books. The architectural details and borders are particularly good and rich, including also the animals and birds so frequent in Romanesque art. Body colors, usually light in tone, replaced the Carolingian outline style, figures were better drawn and more dignified. In the eleventh century the richness of initials and backgrounds increased, often with tapestry effects as in the *Regensburg Gospels*, but there came a decadence, which lasted nearly up to the Gothic period.

Meanwhile other countries were lagging far behind. In France the Carolingian methods became crude and barbarous, as in the *Noailles Bible*. Italy had never even participated in the Carolingian revival and confined itself to clumsy figure painting, mostly in outline, without displaying any decorative ability. The English school contained the older Irish and Anglo-

Saxon work with modifications first due to Carolingian influence, as in *Æthelwold's Benedictional*. With the Conquest, however, the body-color technique replaced the outlined work, as in Germany.

Late Byzantine. The ninth, tenth, and eleventh centuries were the golden age of Byzantine illuminations. Under the Macedonian dynasty (867-1057) there was a return to more classic models, to figure painting in place of the decorative work of the Iconoclastic age. The famous *Paris Psalter* has scenes of antique grace showing a copying of very early models, but even works of purely contemporary art, like the Paris sermons of Gregory of Nazianzus, show an understanding of form and drapery denied to Western art. The brilliant gold grounds, the rich solid coloring, the simplicity of composition and ornament, belong to a severer style. One of the most extensive series of pictures is contained in the *Menologium* of Emperor Basil II (976-1025) in the Vatican. The decline is heralded in the Paris *Homilies of St John Chrysostom* illuminated for Nicephorus III (1078-81), and is quite evident from about 1100. In the two following centuries the figures lose all semblance to life, and the artists turned to decorative work and initials.

Gothic. While Byzantine illumination was dying, the golden age of the art in Europe was beginning, at the close of the twelfth century. First Germany and then France take the lead. The *Hortus Deliciarum* of Herrad of Landsberg, a sort of cyclopædia in design, was a forerunner of Gothic design, whose first steps are shown by Landgrave Hermann's *Psalter*. It was under St Louis (1226-70) in France, however, that the Gothic style of illumination really originated and developed. The lingering influence of Byzantine art is shown in the clear outlines, the solid strong coloring, the small-sized figures, the simplicity of accessories, and the good taste shown in every particular. Of course the ornaments and other details were adapted from the Gothic style of architecture, with growing realism in the use of plants and flowers. A *Psalter* of St Louis is the earliest masterpiece of the type so familiar to the strong style of stained-glass windows. In the course of the fourteenth century a lighter scheme was introduced, with delicate shading instead of flat tints, with more detail and expression. This French-Gothic school was extremely systematic in its use of subjects—in this as in the larger arts—and it originated the type of the *Bible Historiée*, corresponding to the German *Biblia Pauperum*, with its great wealth of illustrations. The other main class of religious illuminated manuscripts was the *Books of Hours*, or prayer book. Such works, executed for the use of royal and feudal personages, were the most exquisite products of the school. But the field of subjects was immeasurably enlarged beyond the religious sphere, which had hitherto reigned alone. Works of poetry and legend, of history and literature of every kind, were decorated as a matter of course with illuminations.

Other countries followed in the wake of France, adopting her Gothic style in this as in other branches of art. Still, though England, Germany, and the Netherlands had flourishing schools, there was a lack of originality and less perfection of design and color.

In France itself the latter part of the fourteenth century saw a further approach to the

methods of naturalistic painting. Exquisite borders of elaborate floral patterns commonly inclosed the entire page, often enlivened by little birds, animals, and figures. Contemporary costume, furniture, and other accessories are reproduced with minute fidelity. Brushwork is evident in the modeling, and faces are exquisitely treated. Work in monochrome, in the light *grisaille*, and in *camaiieu* became popular. The libraries of King Charles V and of the dukes of Berry, Anjou, and Burgundy were enriched with many illuminated manuscripts, often by court illuminators—missals, gospels, psalters, breviaries, books of hours, romances, poems, treatises on falconry, jousting, astronomy, physics. The number of illuminations in some of these works can be judged by the fact that a Bible done for the Duke of Burgundy contained over 2500 pictures. The great public and private collections testify to the enormous productivity of the French schools during the latter part of the thirteenth and the whole of the fourteenth century.

It was at this time that two influences are noticeable, that of Italy and that of Flanders. The Italian Giottoesque revival extended to illumination, and Giotto's contemporary, the Sienese master Simone Memmi, executed illustrations to Vergil and to Petrarca in a simple broad style, imported from wall painting, which henceforth characterized Italian illuminating. The manuscript statutes of the Order of the Holy Ghost illustrate the development of this school. When the popes established themselves at Avignon, the Italian miniaturists with them began to influence the French artists. On the other hand, the powerful school of Flanders began to dominate French art on the northern side, in this as in other branches, with tendency to heaviness, realism, and portraiture, especially remarkable in the following century.

The fifteenth century still belongs to the golden age in the West. In France, except for a few exceptional men who adopted the Renaissance style, led by Fouquet, the Gothic manner still ruled supreme. Here it was the feudal nobles and the royal family, and not the churches or monasteries, for whom nearly all the masterpieces were executed. The *Books of Hours*, or prayer books, were especially beautiful. Those of Philip the Good of Burgundy, at The Hague, and those of Charles the Bold and Mary of Burgundy, at Vienna, are typical of Flemish art, which was taking the lead in powerful naturalism. The *Breviary* of the Duke of Bedford (c 1430) shows Franco-Flemish art in the service of England. The *Hours* executed for Chevalier and the *Jewish Antiquities* of Josephus are among the masterpieces of Fouquet, even more great as a painter than miniaturist, who combined the pure Italian Renaissance with North French realism. In Bohemia also the art was royally patronized by Emperor Charles IV and his son Wenceslas, while King Matthias Corvinus of Hungary helped develop the genius of some of the greatest Italian miniaturists.

Renaissance. Italy forged to the front during this century. The Sforzas at Milan, the dukes of Ferrara, the royal house of Naples, the Medici at Florence, were the greatest patrons besides the cathedral churches. The cathedral of Siena still has the finest collection of illuminated missals and choir books decorated by Liberale da Verona, Girolamo da Cremona, Francesco di Lorenzo, Roselli, and other leading

artists. But the greatest of all artists was Attavante (qv), some of whose work can be seen at Florence (in the cathedral), beside that of Gherardo, of Strozzi, the pupil of Fra Angelico, and others. Some of Attavante's greatest masterpieces were executed for Matthias Corvinus (eg, Missal of 1485-87). This Italian school did not aim at the delicate French effects. It remained broader, preferred to use large capital letters to frame its compositions, aimed at simplicity of composition with few figures.

The invention of printing, while it limited the scope of illumination by greatly diminishing the demand for manuscripts, did not at once give it its death blow. Printed books were often at first illuminated with initials or pictures added by hand in spaces left for them—a practice that lasted even into the first decade of the sixteenth century. Quite as fatal was the introduction of foreign methods into the art, borrowed from fresco and oil painting. The old simplicity and aloofness from naturalism gave way to attempts at effects that were totally foreign to the true spirit of illumination—shading and delicacy of coloring, imitation of natural objects, importance given to perspective and accessories. Prominent among the works of the old school is the somewhat earlier *Grimani Breviary* (c 1477) in Venice, so long ascribed to Memling. A remarkable facsimile of this great work was printed in Germany in 1900. In France the famous Missal of Anne of Brittany (1508, St Petersburg Library) is the expiring effort of the national school, which was succeeded by the Italian masters of the Fontainebleau group. The breaking down of the technical differences between the larger forms of painting and illumination was at this time helped by the work of such artists as Fra Bartolommeo, who practiced both branches. A few works of rare beauty and workmanship continued, however, to be produced, like the *Books of Hours* by Giulio Clovio (qv), of which a fine example is in the library of J P Morgan, New York. Henceforth illumination ceased to count in the history of art. In the reign of Louis XIV the art became extinct, ending in the style called *camaiieu gris*, a kind of monochrome in which the lights are white or gold and shaded so as to emulate bas-reliefs.

Oriental. Among Oriental nations the Persians, Hindus, and Chinese have illuminated manuscripts of great beauty, with figured compositions. The branches of Mohammedan art stricter than the Persians have confined their illuminations to ornamental work, as in the mediæval works of the schools of Cairo and Damascus, mainly represented by magnificent Korans. The best works were produced during the comparatively brief period between the thirteenth and sixteenth centuries, described under INDIAN ART; MOHAMMEDAN ART, ETC.

Bibliography. The best general account of the subject is by J A Herbert, *Illuminated Manuscripts*, "Connoisseurs Library Series" (New York, 1911). There are very good chapters in such general historic works as Woltmann and Woermann, *History of Painting* (Eng trans, 1b, 1880), and especially in Michel, *Histoire de l'art* (Paris, 1905 et seq). The general historic treatment in J Labarte, *Histoire des arts industriels* (1b, 1866), remains excellent. So is the handbook in the French series of Quantin, Lecoy de la Marche, *Les manuscrits et la miniature* (1b, 1884). Valuable treatises have been written on special schools of illumination, eg,

for the Byzantine Kondakov, *Histoire de l'art byzantin, considéré principalement dans les miniatures* (ib., 1886-91). For Irish and Anglo-Saxon Westwood, *Facsimiles of the Miniatures and Ornaments of the Anglo-Saxon and Irish Manuscripts* (London, 1868), an admirable monograph with excellent facsimiles. For the French Martin, *Les peintres des manuscrits et la miniature en France* (Paris, 1909), Vogelstein, *Von französischer Buchmalerei* (Munich, 1911). For the English Bernard Quaritch, *Examples of the Art of Book Illustration* (4 vols., London, 1889), E. M. Thompson, *English Illuminated Manuscripts* (ib., 1895), Heibert, in the work cited above. *Historical Introduction to the Collection of Illuminated Letters and Borders in the National Art Museum*, published by the Victoria and Albert Museum (ib., 1901), *Catalogue of the John Pierpont Morgan Collection of Manuscripts and Early Printed Books* (4 vols., ib., 1906-07). Many of the important manuscripts have been published in facsimile by the Vatican Library, the British Paleographical Society, in the Leyden series of facsimiles, and by other societies and private publishers. Facsimiles of illuminations from various sources are published in such works as De Bastard, *Peintures et ornements des manuscrits* (1832-69), Shaw and Madden, *Illuminated Ornaments from Manuscripts and Early Printed Works* (London, 1833), Tikanen, *Die Psalter-Illustrationen im Mittelalter* (Helsingfors, 1895 et seq.), Kobell, *Kunstvolle Miniaturen und Initialen aus Handschriften des 4 bis 16 Jahrhunderts* (2d ed., Munich, 1892), G. E. Warner, *Illuminated Manuscripts in the British Museum* (London, 1903), the *Facsimiles of the Paleographical Society* and the *New Paleographical Society* (London, 1903 et seq.), *Collezione paleografia Vaticana* (Rome, 1905 et seq.). For the technical side, consult Merrifield, *Original Treatises Dating from the Twelfth to the Eighteenth Centuries on the Art of Painting* (London, 1849), Audsley, *Guide to the Art of Illuminating and Missal Painting* (ib., 1862), Johnston, *Writing and Illuminating and Lettering* (ib., 1908). See MANUSCRIPTS, ILLUMINATED.

ILLUMINATI (Lat nom pl., enlightened). A name which has been borne by four different societies. 1 The earliest was that of the Alombrados in Spain, followers of a seductive mysticism, said to have had Gnostic elements. It first appeared in 1492 and spread rapidly through Spain about the middle of the sixteenth century, though vigorously combated by the apostle of Andalusia, John of Avila, and by Ignatius Loyola. About 1625 it was spreading in France, where it was suppressed in 1635. It was finally suppressed by the Inquisition, though it lingered until the middle of the seventeenth century and had a few scattered followers even at the beginning of the eighteenth. Consult Pelayo, *Historia de los heterodoxos españoles* (Madrid, 1880). 2 A group of enthusiasts and visionaries, known as *Guérinets*, in France about 1684. 3 An association of mystics in Belgium in the latter half of the eighteenth century. 4 A society to which the name is now most commonly applied, the Order of the Illuminati, which was founded at Ingolstadt on May 1, 1776, and soon spread over almost all the Roman Catholic parts of Germany. Its founder at first called it the Order of the Perfectionists. It owed its existence to Adam Weishaupt, professor of canon law at Ingolstadt—a man of

superior abilities and much benevolence, but deficient in practical knowledge of mankind. Impatient of the slow advance of human progress, he conceived the idea of forming an association which should consist of the choicest spirits, labor for the establishment of the dominion of reason, and promote religious and political enlightenment and emancipation. Religious dogmas and forms of worship were to be rejected, a system of deism was to be propagated together with republican opinions. The accession of Baron von Knigge to the new order, and the support which it received from the Freemasons, led to its rapid extension. Weishaupt's knowledge of the Order of the Jesuits, whose pupil he had been, led him to borrow some of the methods of organization which had proved so successful in their hands for building up a strong and united system, especially the absolute obedience of superiors. His arrangements were calculated to place the threads all in one hand by which the holy legion was to be led on, as it was imagined, to the benefaction of mankind, but from this cause the dissolution of the order soon ensued. Weishaupt and Knigge, its two leaders, quarreled with one another. The order began to be openly denounced as dangerous, and on June 22, 1784, an edict was issued by the Elector of Bavaria for its suppression, which was followed by others (March 2, 1785) of a more drastic character, and under the prosecution ensuing the order was suppressed. Weishaupt was removed from his professorship. He returned to Gotha, where he was received and died as court counselor, in 1830, at the age of 82. Various other members were severely punished, and the form of justice was not strictly observed in the proceedings against them. Great importance was at one time attached to the Order of the Illuminati, whose secret influence was regarded, incorrectly, as a principal cause of many of the political events of the time of the French Revolution. The Bavarian government published confiscated documents in 1787. Consult Adam Weishaupt, *Das verbesserte System der Illuminaten mit allen seinen Einrichtungen und Garden* (Frankfurt, 1787), Kloss, *Bibliographie der Freimaurerei und der mit ihr in Verbindung gesetzten geheimen Gesellschaften* (Frankfurt, 1844), Engel, *Geschichte des Illuminaten Ordens* (Berlin, 1906).

ILLUMINATING See ILLUMINATED MANUSCRIPTS.

ILLUMINATING ENGINEERING SOCIETY See ILLUMINATION.

ILLUMINATING GAS See GAS, ILLUMINATING AND FUEL.

ILLUMINATION. The use and arrangement of sources of light so as to render objects readily visible, with due consideration to available facilities and proper economy. The extreme brightness of modern illuminants is recognized, not only on account of the inartistic effects due to uneven illumination of surfaces, but also for the injurious influence on the human eye. Modern illumination is concerned chiefly with the various forms of electric and gas lamps in use, such as the electric incandescent and arc lights and gas burners of the mantle type. (See ELECTRIC LIGHTING, GAS.) For interior lighting, the past few years have seen the rapid displacement of carbon filament incandescent lamps by those of tungsten, and of open-flame gas burners by incandescent mantle lamps, whereby the same or a greater amount of light is secured

at a lower cost, or, what is the usual case, for the same cost a much greater amount of illumination is obtained. Furthermore, there have been developed illuminants of such intense brightness as to make them unsuitable for general interior illumination, except for large areas, such as stores, public halls, workshops, railway stations, etc. To secure the best results for each particular location and problem is the province of the illuminating engineer.

For the comparison of various illuminants, the standard of reference is the standard candle (see PHOTOMETRY), while the degree of illumination on a surface distant 1 foot from a standard candle is called a "foot candle." To express luminous flux, there is used a unit called the "lumen," equal to the flux emitted in a unit solid angle by a point source of one candle power. For the C G S unit of illumination, one lumen per square centimeter, the name "phot" has been proposed, this being equal to 929 lumens per square foot. To put this ratio in another way, one foot candle is one lumen per square foot and is equal to 1.0764 milliphot. The unit of illumination commonly employed is the lux, which is equal to 0.0929 lumen per square foot, or 0.0929 foot candle.

In providing illumination a surface of reference, called the "plane of illumination," perpendicular to the rays of light, is chosen, which is that on which the effective degree of brightness for the special purpose is desired. In offices, schools, libraries, or stores, this reference plane is commonly taken at a height of from $2\frac{1}{2}$ to 3 feet from the floor, approximately that of a desk or table, and in certain locations, such as the book stacks of a library, the reference plane is chosen somewhat higher than this, say 5 to 6 feet. A picture gallery requires a vertical reference plane, the surface extending usually from 5 to 10 feet from the floor. Special problems in vertical lighting are often solved by an arrangement of lamps in vertical or horizontal rows, shielded by columns or coves, for bringing out the details of a chancel of a church, or a recess in an art gallery, as well as to display goods in show windows, where it is essential that the articles displayed may be adequately illuminated, while not disclosing the direct sources of light. Obviously there must be considerable calculation, involving not only the nature and dimensions of the area to be lighted, but also the intensity and distribution of the illuminants so that illuminating engineering involves no small amount of theoretical consideration as well as practical application.

Investigation shows a wide variance in the intensity of illumination required for different purposes. For ordinary reading as well as for drafting rooms and work of a similar character, an illumination of from 2.5 to 4 foot candles is usually satisfactory, while for the examination of or work on certain textiles, and in operations where the goods worked upon are dark in color or black, a higher degree of illumination is necessary, sometimes being carried to as much as 8 foot candles for satisfactory results. Proper illumination, however, requires not only sufficient light, but also the distribution of radiation in such manner that there are no deep shadows or points where sharp contrasts of light and shade are noticeable. Uniformity of illumination is one of the causes of the pleasing effect of the great area of the Grand Central Terminal concourse in New York City, with its adequate

and even illumination, both by daylight and by artificial light.

Illuminating engineers have made an extended study of the bad effects of glare, which is the regular or specular reflection of light from surfaces of paper, furniture, etc. At a certain angle the incident light is reflected directly from the page of a book, or the polished top of a piece of furniture, or even from the walls of a room, into the eye of the observer, making it less sensitive to detail and causing a strain and consequent fatigue that will lead to injurious results. Glare may be avoided by using more lamps of diminished brightness or by changing the position of the lamps, so that their radiations shall reach the desk or printed page at an angle that will cause diffuse reflection. For the general reduction of glare, however, the surfaces of walls and furnishings of a room must be of such nature and color as to diffuse the incident light from every possible angle. For interior illumination all lights should be shielded by globes or shades to prevent the radiations coming with undiminished intensity to the eye, as this causes excessive eye strain and its injurious consequences.

In order to avoid the many unsatisfactory effects of what is called "direct lighting," and also for the purpose of producing a more uniform illumination in the interior of buildings, the "indirect" system and the "semi-indirect" are both largely in use. The indirect system commonly employs an opaque bowl, suspended from the ceiling of the apartment to be lighted. Lamps are placed inside the bowl, from which the direct radiations are first received on the ceiling and upper portion of the walls of the apartment, resulting in a wide diffusion and satisfactory illumination without glare. In this system, however, some of the bowls used cause shadows on floor and furniture, so that the semi-indirect method is frequently preferred by architects and illuminating engineers, as in this latter system the lamps are placed in bowls made of translucent material, such as opalescent or white glass, alabaster, etc., with the result that a portion of the radiation from the lamps is received on the ceiling and walls and diffused by them, while another portion passing through the bowl is received directly on the floor and the furniture, but of so softened, diffused, and uniform a quality as to render the effect restful to the eye, yet providing sufficient illumination according to circumstances to render it easy to read or do any other kind of work in any part of the apartment lighted.

In school buildings much attention is being paid to the principles of correct illumination, as a large proportion of the increasing amount of eye trouble among school children doubtless is caused by bad lighting conditions in the class rooms, not omitting those that are usually worse at home. Children are frequently allowed to study with an unshaded light facing them at the desk. Likewise, in stores, factories, and workshops, faulty arrangements for lighting are also common. In machine shops an unshaded electric lamp is often hung in front of or directly over a lathe or milling machine, which, though throwing a bright light on the work, puts a blinding glare in the eyes of the workman the moment he looks up from the work, and making deep shadows around the base of the machines near the floor, where a man is likely to trip and fall, with resulting injury.

The color of the illuminant also is a matter of great importance in many illumination problems. Naturally, for the examination of textiles, the illumination of art galleries or public rooms, the nearest approach to daylight, at present realized in artificial illuminants in the tungsten lamp, must be secured. In many workshops this consideration can be neglected, and one of the most efficient illuminants in use, the mercury vapor lamp, with a pronounced green hue, is highly favored for a great variety of manufacturing plants, but is unsuitable for public places, owing to the ghastly appearance produced on the human countenance by the absence of red radiations from the lamp.

For street or outside illumination, lamps must be placed at such a height that the radiation will not strike directly in the eyes of pedestrians and drivers. They must be so spaced that there will be no areas in deep shadow, and at the same time must be located with regard to one another, to secure the maximum amount of radiation from each unit, without the waste which would accrue from too close spacing. According to economic and civic conditions in cities and villages, there are many systems of street lighting in use, ranging from incandescent lamps 300 feet apart, an arrangement suitable for small villages, to the most powerful flaming arc lights in pairs, providing a uniform illumination of sidewalks, roadway, and buildings with a brightness sufficient to enable one to read newspaper print.

It is estimated that at least \$200,000,000 a year are spent in the United States for lighting by oil, gas, and electricity, and that 20 per cent of this sum is wasted by faulty design and arrangement of the details of illumination. The work of the illuminating engineer is therefore of benefit to the community in many ways, as his advice in the installation and arrangement of lighting systems results in the social, eco-

nomic, and physiological benefit of the community as well as in the saving of large amounts of money.

The importance of the artistic, physiological, and industrial effects of proper lighting has attracted the attention of electrical engineers and architects and resulted in the formation of a society for the discussion and investigation of problems concerning this subject. The Illuminating Engineering Society in the United States was organized in 1906 and in 1915 had a membership of about 1500, comprising electrical engineers, architects, and decorators, as well as designers and manufacturers of fixtures. The society aims to bring together the interests enumerated herewith and to publish results of their investigations in both public and private lighting work. Its object is the advancement of the theory and practice of illumination, and the dissemination of knowledge relating thereto. Frequent meetings are held, as well as an annual convention, where papers are read and discussed concerning the latest practice and art of both public and private illumination. In London a society of the same name and with the same objects in view was founded in 1909, and there is a similar organization in Paris.

FIG. 1. ILLUSIONS OF REVERSIBLE PERSPECTIVE (From Titchener, *Experimental Psychology*)

Notice that while you look at the figures, without changing the position of the book, certain lines or planes appear now farther from and now nearer to the eyes. To show the influence of fixation and eye-movement, the figures must be drawn on a large scale, and preferably in white lines on a black ground.

1907-); *Transactions of the Illuminating Engineering Society* (ib., 1911-); H. Pender (ed.), *American Electrical Handbook* (ib., 1914). For the architect and engineer as well as the general reader: Cravath and Lansing, *Practical Illumination* (ib., 1907); W. S. Franklin, *Electric Lighting* (ib., 1912); Louis Bell, *Art of Illumination* (ib., 1912); C. E. Clewell, *Factory Lighting* (ib., 1913).

ILLUPI, il'ū-pī (East Indian name), **ILLUPIE**, **ELLOOPA** (*Bassia longifolia*). An East Indian evergreen tree of many local uses. The bark is prescribed in cases of itch; the gummy juice is employed as a remedy for rheumatism; the leaves and the milky juice of the immature fruit are also used in medicine; the flowers, roasted or boiled, furnish an article of food, and the seeds yield a greenish fixed oil, known as illupi oil.

ILLU'SION (from Lat. *illusio*, mockery, from *illudere*, to mock, from *in*, in + *ludere*, to play).

FIG. 2. MÜLLER-LYER'S REVERSIBLE STAIR FIGURE.

The figure fluctuates as you observe it. If at first you seem to be looking at a flight of steps, the appearance soon changes, so that you seem to see a piece of overhanging masonry. To show the influence of fixation and eye movement, the figure must be drawn on a large scale.

In general, a distorted or abnormal perception (q.v.). The word is used in English psychology in two principal senses: 1. As the counterpart of hallucination (q.v.), "an assimilation of an hallucinatory character" (Wundt), a distortion

FIG. 3. VARIABLE ILLUSIONS OF EXTENT. (From Sanford, *Course in Experimental Psychology*.)

In *A* the space covered by the 8 dots at the left seems greater than that between the 8th and that at the extreme right. In *B* the quadrants with inscribed radii appear greater than those that are empty. The figures *C* and *D* (Helmholtz Squares) appear respectively higher and broader than they should by objective measurement. Figure *E* is a variant of *A*, the illusion being the reverse of that in *A*; here the eye tends to fixate the middle point of the left-hand distance and thus to apprehend that distance without traversing its length.

or misinterpretation of the contents of perception, due to an abnormal irritability of the sensory centres of the brain cortex. The distortion

may take the form of subjective enhancement of the intensity of stimulus, as when a gentle

FIG. 4. THE ARROWHEAD AND FEATHER ILLUSION. (From Sanford, *Course in Experimental Psychology*.)

In the first row the distances between the points of the angles are equal, and the vertical lines subject to illusion are all equal to these distances and to one another. In the second row of figures the top and bottom lines are all equal; in the third and fourth rows the horizontal, in the fifth row the vertical, and in the sixth row the horizontal lines are all equal in length. In the lowest row the parts of the horizontal lines marked off by the points of the angles are all equal.

knocking at the door is taken for the growl of thunder; it may involve a qualitative alteration of the stimulus, as when the monotonous sighing of the wind is heard as angelic music; or it may consist in a fantastic modeling and grouping of the forms of perceived objects, as when a dimly seen stone or tree stump is regarded as a ghost. Sane persons of imaginative disposition are liable to illusion, more especially at times of mental stress or overwork; and, indeed, the readiness with which we can find faces in the fire and monsters in the clouds shows how short is the path from normal to abnormal assimilation. We reach the stage of unquestioned abnormality with patients who interpret the half-heard conversation of passers-by as threats directed against their life and see on the face of every stranger an expression of disgust or contempt or menace.

2. In its second meaning illusion is a perversion of the contents of perception due to structural or functional peculiarities of the perceptual apparatus (sense organs and cortex). So far from being abnormal, this form of illusion is both natural and necessary. We speak

FIG. 5. CONSTANT ILLUSIONS OF EXTENT. (From Titchener, *Experimental Psychology*.)

In A-E, the vertical appear to be greater than the horizontal dimensions. A and B show further peculiarities, mentioned in the text. F gives rise to no illusion; it is inserted for comparison with B.

FIG. 6. VARIABLE ILLUSIONS OF DIRECTION. (A the Hering figure, B Wundt's figure.)

The objectively parallel lines *ab* and *cd* in A seem to be nearer together at the ends than in the middle. In B the opposite is the case.

of the perceptions as "illusory" simply because they are of a character different from that which our previous knowledge of the stimuli,

Wundt (q.v.), who seeks, so far as possible, to account for the illusions in physiological terms (fixation and eye movement); the second by

A

B

FIG. 7. VARIABLE ILLUSIONS OF DIRECTION. (Zöllner's figures.)

In A the vertical lines and in B the diagonal lines in the square appear to converge and diverge, though objectively they are parallel.

or our experience under other conditions, would lead us to expect. For instance, we know that all four sides of a square are equal. We expect therefore that a square will look as high as it is broad. As a matter of fact, the perfect square always looks like a rectangle whose vertical dimension is somewhat greater than the horizontal. Again, we are extremely familiar with the appearance of the circle, which we have seen in all sorts of figures and under the most varied conditions. When, then, we inscribe a square in a given circle, we do not expect that the appearance of circularity will be affected. In actual fact, the circle seems to be pinched in at the points where its circumference is touched by the angles of the square, so that we perceive not a circle at all, but four arcs apparently belonging to circles of less radius than the circle which should include the square. No one whose vision is normal can escape these illusions; their occurrence is, as we shall see, intrinsic to the perceiving eye in its function as a "space organ"; the perceptions are illusory only in the sense that they conflict with our other knowledge, i.e., with the verdict of the "mathematical" or "measuring" eye.

The most important of these "normal" illusions are the spatial illusions of touch and sight. The latter, which were first demonstrated by J. Oppel (1815-94) in certain simple geometrical figures, have been termed collectively the *geometrical optical illusions*. They are exceedingly numerous, and explanations have been almost as plentiful as illusions. Three attempts at systematic treatment have, however, been made by later investigators; the one by

Lipps (q.v.), who offers a "mechanical æsthetic" principle of explanation. Lipps's theory is, in brief, that we read into the lines and figures in question forces and counterforces, strivings and resistances, akin to those which we experience in ourselves; so that the column "seeks" or "strives"

FIG. 8. CONSTANT ILLUSION OF DIRECTION. (Von Recklinghausen.)

Look at the centre of the figure with one eye, from the distance dd , and the whole appears as a field of squares.

to rise, the horizontal line to stretch itself, the circle to "hold itself together," etc. The third theory emphasizes our own general attitude to the object of perception. Just as we constantly

misread the headlines of the newspapers because we are prepared or predisposed for news of a certain sort, so do we perceive a geometrical figure in one way if we take it as a total impression, in another way if we take it critically, analytically, limiting our attention to certain lines and disregarding others, etc. We shall here give Wundt's classification and explanation, partly because they are the most complete, and partly because, in matters of perception, physiological conditions must take priority over psychological.

The first group of geometrical optical illusions contains (a) the illusions of reversible perspective. It is a familiar fact that many outline figures—a bowl, an open book, a cube, a stairway—will "turn inside out" in the most perplexing

FIG. 9. ASSOCIATIVE ILLUSIONS. (From Sanford, *Course in Experimental Psychology*.)

In A and B the breadth of the included spaces, and in C and D the included angles, are objectively equal. In E and F the small central lines and spaces are equal. In G the circle surrounded by small circles is the same in size as that surrounded by large circles, though it appears larger.

way as one looks at them. Even two crossed lines, drawn X-wise upon a sheet of paper, may be made to take on the appearance of a right-angled cross, seen in perspective, with either the lower or the higher point of the line which forms the horizontal arms nearer to the observer. Very little practice suffices to show that the direction of perspective depends here upon the point fixated and the course along which the eye moves; the point of fixation is the point nearer the observer, and movement of the eye towards a given point brings that, in its turn, to the front of the figure. (b) Next follow the illusions of extent, variable and constant. A dotted line looks longer than a drawn line of equal objective length, for the reason that it offers more halting places as the eye moves along it. Draw an outline square; then a group of horizontal lines filling the same area as the square; and then a similar group of vertical lines. The horizontal group looks higher, the vertical group broader, than the objectively equal square, for the reason, again, that the

grouped lines offer more obstacles to the passage of the eye over the area of the figure. One of the most disputed figures of this class is the illusion of Müller-Lyer, or the arrowhead and feather illusion. Draw two vertical or horizontal lines of equal length. Tip the two ends

FIG. 10. THE STROBOSCOPE OR ZOETROPE.

Looking at the figures through the slits in the rim, you get, when the instrument is rotated, an effect of continuous movement, similar to that of the kinetoscope, and depending on the same conditions.

of the one with oblique lines directed inward (arrowheads), and the two ends of the other with oblique lines of the same length directed outward (arrow feathers); the latter appears considerably the longer of the two. Wundt's explanation is that the inward-going obliques offer a check to the passage of the eye along the principal line, while the outward-going obliques

FIG. 11. AN ILLUSION OF MOVEMENT. (From Sanford, *Course in Experimental Psychology*.)

Move the figure around in a circle in its own plane, and observe the apparent motion of the six outer disks and the reverse movement of the central cogwheel.

favor a continuance of eye movement. The constant illusions of extent (due to asymmetries of muscular action about the eyeball) are summed

up in a right-angled and equal-armed cross. The vertical line in this figure seems to be longer than the horizontal, the upper vertical arm longer than the lower, and, in monocular vision, the outer horizontal arm looks longer than the inner. (c) Thirdly, we have variable and constant illusions of direction. Draw a large outline square, marking in one of the diagonals, and three or four lines parallel to the diagonal, at equal distances on either side of it. Now proceed to crosshatch the oblique lines, cutting the diagonal with short vertical

straight lines, owing to the concavity of the retina. (d) There remains a group of illusions which Wundt classes as "associative," i.e., as psychological, not physiological, in origin. If equal short horizontal lines are drawn, some grouped closely together and some widely spaced, the latter appear longer than the former, the length of the line is "assimilated" to the size of the interspaces. In the same way, if two broad and two narrow rectangles are drawn, of equal height and separated by equal spaces, the space between the larger rectangles will look

FIG. 12. MIXED ILLUSIONS (From Titchener, *Experimental Psychology*)

In 1 compare the size of the left-hand circle with the inner circle in the middle figure, also the outer circle of the middle figure with the right-hand circle. In 2 note the apparent lengths of the halves of the various bisected lines. In 3 the shorter parallel lines seem farther apart than the longer parallels (Wundt). In 4 "the dots are really at the level of the lower line, but seem a little too high, especially when the figure is held so as to make the lines oblique" (Sanford). In 5 the middle sections of the five broken lines are all equal and parallel, though they appear to be otherwise (Lippis).

pieces, the two adjoining obliques with short horizontal pieces, the two oblique lines next beyond these with verticals again, the two next with horizontals, and so forth. Notice that the parallel obliques no longer look parallel, but appear to converge and diverge alternately. The explanation of this and similar illusions is that small angles are overestimated, and large angles relatively underestimated, and the reason for such overestimation, again, is that it takes more muscular effort and energy to start a movement of the eye than it does to continue a movement already begun. The constant illusion of direction is that, under certain conditions of fixation, hyperbolas are perceived as

smaller than the space between the narrower, the interspaces are differently estimated by "contrast" with the adjacent figures. (See CONTRAST.) (e) Finally, we may, of course, have figures in which several of the above-mentioned motives, physiological and psychological, cooperate to produce the illusion.

It is significant that, with the associative illusions, Wundt is forced to leave the periphery for the centre, the sense organ for the cortex, physiology for psychology, since, if central or psychical factors are of influence in one sort of illusory perception, there seems to be no a priori reason why they should not be effective in others. Recent investigations show, in fact, a distinct

tendency to give the central organ a far larger share in the determination of perception than is allowed it in Wundt's *Physiological Psychology*, concepts like predisposition, attitude, set, tendency, have been introduced and are freely used, and experiments have been made in which variation is not confined to the figures studied, but extends as well to instructions for observing, direction of attention, etc. We may perhaps believe that a satisfactory theory of illusory perception will combine the first and the third of the theories mentioned above, Lipps's view, at least in any general form, must probably be given up.

We may further include under the general heading of optical illusions (1) the physical illusions produced by mirrors, lenses, prisms, etc. (see MIRAGE, REFLECTION, REFRACTION), (2) the physiological illusions of color (see AFTER-IMAGES, CONTRAST), (3) illusions of movement, such as, e.g., the apparent movement of the moon when viewed through drifting clouds, and (4) illusions of distance. Under the latter category falls the apparent enlargement of sun and moon when seen near the horizon. The distance between the observing eye and the horizon seems to be longer (owing to the haziness of the air, the number of intervening objects, etc.) than the distance between the eye and the zenith. But if two objects subtend the same visual angle (give the same retinal image) at different distances, the one which is farther off must be larger than the other.

Touch, no less than sight, is subject to spatial illusion. (a) If two compass points are set down upon the skin, first on an area of greater and then on an area of less sensitivity, the distance between them will seem to be greater in the former case than in the latter. Give the points, e.g., a separation that enables them to be clearly perceived as distinct impressions when they are set crosswise upon the skin of the upper arm. Now draw the compasses down the inner surface of the arm to forearm, wrist, and finger tips. The two parallel lines which they describe will appear to converge and diverge upon the regions of less and greater sensitivity. Or set the points down, vertically, upon the upper and lower lips, and draw the compasses outward, towards the ear. The points seem to converge as they travel over the skin. (b) Cross the tip of the second over that of the third finger and place a marble or other small object between the crossed tips. Since the two surfaces now stimulated are never affected, in ordinary life, by one and the same object, but only by two different objects, the single marble is "felt" as two. This illusion of localization is described by Aristotle, in his tract *On Dreams*. (c) Draw a given length of coarse thread between the finger and thumb, at first slowly and then more quickly. The thread appears to be much longer in the former case, the separate pressure sensations have a longer time in which to run their course undisturbed by subsequent pressures, and fullness of sensation is interpreted as length of thread. (d) If a point be moved over the skin at a uniform rate, it will seem to travel more quickly as it crosses areas of greater sensitivity and to become slow again as it enters regions of less sensitivity. See also MOVEMENT, PERCEPTION OF.

A striking illusion of temperature is described by the English philosopher Locke (qv). Hold the one hand in a bowl of heated, the other in

a bowl of cold, water. After a short time plunge both hands into a bowl of lukewarm water. This will appear hot to the cooled, and cold to the heated, hand. The illusion is due to the preceding adaptation of the temperature organs of the skin. (See CUTANEOUS SENSATIONS.) An equally striking illusion in the sphere of kinæsthetic sensation is afforded by the fact that a small weight, when lifted, always appears heavier than a larger weight of the same objective heaviness. The smaller weight stimulates intensively a limited cutaneous area, with its underlying tissues, the larger weight stimulates lightly a large area of skin and leaves the underlying tissues practically unaffected. These instances, which could be multiplied almost indefinitely, show clearly that the term "illusion" implies nothing more than a discrepancy between perception and objective measurement.

ILLUSTRATED LONDON NEWS. The oldest illustrated weekly, founded in 1842 by Herbert Ingram.

ILLUSTRATION. A term generally used in reference to the pictorial decoration and illustration of books. In the more usual sense book illustration is the addition to a book of pictures (and indirectly of maps and plans) which may aid in the right understanding of the text. This service they may render in a serious and practical way by giving views of buildings, accurate drawings or other reproductions of dress, portraits of individuals, copies of works of art named, and the like, these being things which are impossible adequately to describe in words, and of which a clear presentation to the reader is desired. On the other hand, the illustrations may also be merely extensions of the text, thus, when Cruikshank or Leech illustrates *Oliver Twist* or *Mr Jorrook's Hunt*, the description or narrative passage of the text is in a sense repeated by the artist—a part of the story is retold in line and light and shade.

A book consisting almost entirely of pictures, or having those for its principal subject, cannot be said to be an illustrated book. Thus, the volumes of the *Paris Salon*, with large photographs of the paintings and statuary of the year with a text which is rather perfunctory, or that little volume which made the delight of schoolboys 60 years ago, *Mr Jonathan Oldbuck*, or, in more recent times, the albums of Caran

D'Ache and Forain, or Howard Pyle's or T. S. Sullivan's "Tables," are of this class. In the one case the pictures are the book, and the text is not absolutely needed, in the other case the pictures and the brief legends or the rewritten Æsop Fable 100 words long, form together a humorous study of which the picture is much the more important part. This is hardly illustration. And in like manner, when the pictures drawn for a book are large, and few in number, and are printed on separate plates and bound in, they have less the air of illustration, and indeed serve less well their purpose as illustration, than those which, being smaller, are inserted in the text. The very admirable pictures by Albert Lynch given with the quarto edition of Maupassant's *Pierre et Jean*, although spoken of with great respect by excellent judges and although admirable compositions, are yet less effective as illustrations than the less pretentious and really less able drawings by Myrbach, and others which are scattered through the duodecimo volumes of Daudet's *L'Immortel* or Bourget's *Mensonges*, and immeasurably inferior to the roughly cut headpieces by Meissonier in *Les contes rémois*. From this point of view the famous "vignettes" of the eighteenth-century illustrated books are the least satisfactory of illustrations. They render, indeed, a single scene or incident of the story, but they are wholly unrealistic in character, the figures ordinarily being posed without general truth of attitude or truth of gesture, and while they are attractive and instructive as works of the draftsman and of the engraver's art, they are also models of all that is to be avoided in book illustration.

History The history of illustration is hard to treat as a continuous narrative. The Egyptian manuscript *Books of the Dead* contain numbers of delicate and very ornamental paintings, usually of small size and combined with the text in an admirable way, and the paintings in the Ani Papyrus in the British Museum, and a few other recently discovered manuscripts, have larger drawings. On the other hand, we are without any knowledge of Greek manuscripts of an early date with drawings accompanying them. Of Roman Imperial manuscripts with illustrations there is nothing known prior to the Christian epoch, but the paintings which accompany the famous *Genesis* of the Vienna Museum, certain manuscripts of plays of Terence, and a very few other contemporary books remain to us. It is the opinion of excellent critics that these monuments of a decadent epoch will mislead us if we try to judge from them the character of work of the earlier and better times, but those who urge this may forget that one art continues to flourish while others lapse. Moreover, the antique look and something of the pagan spirit are still to be found in the Christian illustrations of the fourth and fifth centuries, whereas the Church has had its own way with the mediæval manuscripts of the eleventh and twelfth centuries, those of much earlier date, like the Irish and the Anglo-Saxon, are too barbaric and too purely ornamental to be considered as actual illustrations, despite the decorative effectiveness of the illuminated page.

The mediæval manuscripts combine illustration by means of miniatures with the decoration of the page in a very wonderful way. (See ILLUMINATED MANUSCRIPTS.) With the re-

vival of learning in Italy the painting of miniatures became an elaborate art, and some of these miniatures of early time are finished pictures with background, distance, and everything that a modern landscape or genre picture has, except cast shadows. Even the shadows appear towards the close of the fifteenth century, and with the shadows comes the end of illumination considered as a separate art. The famous *Breviarium Grimalii* is, however, without shadows and yet is dated at the very close of the fifteenth century, and the borders which Albert Dürer drew for the margins of the printed book called *Mammilian's Prayer Book*, and which were executed in 1515, have their elaborate groups of busy little figures drawn without traceable or outlined shadows, although the figures themselves may be partly relieved on a dark shading.

With the earliest printed books come the earliest wood engravings which are of exclusively artistic character. The *Hypnerotomachia* of the so-called Poliphilo (Francisco Colonna), printed by Aldus at Venice in 1499, has large and very open drawings, sometimes filling nearly the whole of a small folio page. The *Epistles of Saint Jerome*, of 1497, has a great number of small illustrations, not larger than a lady's visiting card, but full of character and containing sometimes a dozen figures boldly drawn and skillfully grouped. The several illustrated editions of the *Divine Comedy* of Dante, of which perhaps the earliest is of 1497, have woodcuts and illustrations also in outline. During the next century this same tendency to simple and rather formal illustration, in outline except for some arbitrary shading, continues, and it is not to be doubted that the expectation was that hand coloring would be called in to complete these designs. In fact, many books, with their pictures elaborately colored by hand, remain to us from this epoch. The constant reprinting of the early books tended to preserve the abstract and simple character of illustration, and it is not until the middle of the sixteenth century, with the copper engraved plates illustrating the different manuals of swordplay, and the delicate little woodcuts illustrating the Old Testament, and the "Dance of Death" ascribed to Holbein, that a freer style is introduced. Entire freedom in drawing for wood engraving came slowly, even Albert Dürer's work is largely confined to outline, and single plates of the "Apocalypse" and the "Life of Mary" are found elaborately painted in water color and touched with gold. But with the last quarter of the sixteenth century complete light and shade is sought for, as in the woodcuts ascribed to Jost Amman, published by Feyerabend of Frankfort, and those of Vecellio, dated 1590. In the seventeenth century were published quaint books of history and topography, sometimes adorned with crowded battle pieces, or, like the curious history of the wars between England, France, and the United Provinces, with views of sea fights, minutely engraved on copper and effective enough in a black and crowded way. One of these pictures shows the great fire of London in 1666, the book being printed two years later. The books published by Matthæus Merian of Frankfort with the admirable views of German cities are of this time and Wenceslaus Hollar began his wonderful career of simple and perfect work as an engraver in Merian's employ. Book illustration was, however, feeble during the hundred years

from 1650 to 1750, although the fashion of providing elaborate frontispieces and title-pages engraved on copper produced some very admirable samples of the engraver's art. The French *Livres à Vignette* mentioned above are noteworthy, in spite of their inadequacy, as helping to restore the art. (Consult De Goncourt, *Les vignettistes*, Paris, 1868.) Wood engraving was revived in the course of the eighteenth century, and as early as 1775 Thomas Bewick produced his illustrations of Æsop's *Fables* and his natural-history books, the *Quadrupeds* and the *Birds*, the little narrative drawings serving as tailpieces to the chapters of the quadrupeds forming the most important step in book illustration which had been made for a century.

The great modern movement in book illustration begins about 1830 with the woodcuts made for French classics, such as Molière and Bernardin de Saint-Pierre, and in England with the earliest books illustrated by Cruikshank. The work of Rowlandson, ending as Cruikshank began, must have influenced him greatly at first. But Cruikshank soon worked out of the exaggerated and purely farcical manner which the earlier artist retained to his death, and achieved distinction primarily as an illustrator of books, keeping up his full power until an advanced age. His work exists in great abundance in woodcut and also in a simple kind of etching, in which last process he was followed and surpassed as to technical excellence by John Leech.

For the important influence of the humorous journals, see CARICATURE. The foundation of *Punch* led to the creation of a whole school of illustrators, and Leech, as a draftsman for wood engraving, was the chief of Englishmen of his time, keeping up his power till his death, in 1864. Richard Doyle and Hablot K. Browne were his contemporaries, Du Maurier and Charles Keene, the latter one of the greatest artists in black and white, were his successors. All these men did much work in illustrating separate books. The Frenchmen Jean François Gigoux, Tony Johannot, Sulpice Chevallier (Gavarni), were their contemporaries in the French world of books.

The book illustrations of the years since 1870 are remarkable for the introduction of photographic process prints (see PHOTO-ENGRAVING), but there has been also, particularly in the United States, a notable rise and decline of wood engraving (q.v.). Colored illustrations can be produced now at reasonable cost, and some of them are of great beauty. (See THREE-COLOR PROCESS, LITHOGRAPHY.) Of decisive influence upon the development of illustration of the present day are the numerous illustrated magazines and newspapers in America and Europe. See PERIODICAL, NEWSPAPER.

That form of illustration which is sometimes called Extra Illustration, or Grangerism (from James Granger, died 1776, a celebrated print collector), is the insertion into a book, by way of illustration, of pictures which did not originally belong to it. Thus, a history or an historical novel may be illustrated by collecting portraits of men famous at the time dealt with in the book, and scenes of historical interest previously drawn and engraved, and these prints may be bound into the book or simply laid between its leaves. In this way a book of one volume may be extended to a dozen, and as some of the plates will be large, the smaller ones are occasionally "inlaid," i.e., their edges

are fitted into a hole cut in a larger sheet of paper, while the printed leaves are treated in the same way, so that all the leaves of the enlarged book may be of the same size. This proceeding has been the cause of the destruction of many valuable books, for a whole volume will be sacrificed for the sake of its frontispiece or its illustrated title-page, or marred by the extraction from it of one or two portraits. Consult Bouchot, *The Book*, translated by Bigmore, edited by Grevel (London, 1890); Joseph Pennell, *Modern Illustration* (ib., 1895); id., *Illustration of Books* (ib., 1896); White, *English Illustration*, "the Sixties" (ib., 1897); Blackburn, *Art of Illustration* (Edinburgh, 1901); Crane, *Decorative Illustration of Books* (London, 1901); Kirkbride, *Engraving for Illustration, Historical and Practical Notes* (New York, 1903); Sketchley, *English Book-Illustration of Today* (London, 1903); Hardie, *English Coloured Books* (ib., 1906).

ILLYRIA, i-lī'rī-a. See ILLYRIANS; ILLYRICUM.

ILLYRIAN PROVINCES. See ILLYRICUM.

ILLYRIANS (Lat. *Illyria*, from Gk. Ἰλλυριοί, *Illyrioi*, from Ἰλλυρίς, *Illyris*, Ἰλλυρία, *Illyria*, Illyria). A people of doubtful ethnic kinship, who at the dawn of history inhabited the northern and eastern shores of the Adriatic and the northwestern part of modern Greece. From this latter region a migration took place at a very early period across the Ionian Sea to the southeastern corner of Italy. It seems, on the whole, plausible to regard the modern Albanians as the representatives of the Illyrians, both in ethnology and in language. See ALBANIA, ALBANIAN LANGUAGE.

ILLYRICUM (Lat., from Gk. Ἰλλυρικόν, *Illyrikon*, from Ἰλλυρίς, *Illyris*, Ἰλλυρία, *Illyria*, Illyria). The Roman name of a Roman administrative district, whose limits in ancient times varied very considerably (Illyria was the name of the territory occupied by the Illyrians, Illyricum often included much more than that territory). In the fourth century B.C. the Illyrians inhabited the eastern coast of the Adriatic Sea and the adjacent islands, with the western parts of Macedonia as far south as Epirus. Philip of Macedon conquered the country as far as the river Drilon (modern Drino), and thence arose the division into *Illyris Græca* and *Illyris Barbara*, afterward *Illyris Romana*. The former, now Albania (q.v.), was incorporated with Macedonia. *Illyris Barbara* or *Romana* was divided into Iapydia, Liburnia, and Dalmatia. There were Greek settlements on the coasts of Illyria as early as the sixth century B.C. The kings of Macedonia long fought with the Illyrians, Philip, father of Alexander the Great, finally subdued them and annexed part of their country. After this time the Illyrians were much addicted to piracy, which soon brought them into collision with the Romans, who waged a successful war against the Illyrian Queen, Teuta, in 229 B.C. About 168 B.C. the southern Illyrians became subject to Rome, but the subjugation of the northern Illyrians was not effected until the time of Augustus (33 B.C.).

Under the Roman Empire the country of the Illyrians, under the name of Dalmatia (in the wider sense), formed the southern part of the diocese of Illyricum, which extended as far north as the Danube. It is represented in modern times by part of Croatia, nearly all of Bosnia, Dalmatia, Herzegovina, Montenegro, and the northern part of Albania. Under Constantine the prefecture of Illyricum embraced a great part of the Roman dominions in Europe east of the Adriatic. A decree of Napoleon, Oct. 14, 1809, organized the dominion known as the Illyrian Provinces, erected out of territories taken from Austria. It comprised Carniola, part of Carinthia, most of Croatia, Dalmatia, Istria, Fiume, etc. At his fall these provinces were united as a kingdom to the Austrian Empire, and some alterations were made in its boundaries. The kingdom was divided into the two governments of Laibach and Trieste, Laibach being the capital, which arrangement continued till 1849, when the kingdom was subdivided, for administrative purposes, into the duchies of Carinthia and Carniola, and the coast district, containing Gorz and Gradisca, Istria and Trieste. Consult *Bahn, Die Ursprung der römischen Provinz Illyrien* (Grimma, 1876), Zippel, *Die römische Herrschaft in Illyrien bis auf Augustus* (Leipzig, 1877), Eduard Meyer, *Geschichte des Altertums*, vol. 1 (2d ed., Stuttgart, 1907), Schutt, *Untersuchungen Zur Geschichte der alten Illyrien* (Bieslau, 1910).

ILMEN, il'mën, *Russ pron* ēly'-mä-ny'. A lake in the Russian Government of Novgorod, situated about 60 feet above the level of the Gulf of Finland (Map Russia, D 3). Area, over 350 square miles. The banks are mostly low and in some parts marshy. Ilmen receives many streams, and its waters, which discharge into Lake Ladoga through the Volkhov, are almost always muddy. The fisheries of the lake are extensive and exploited largely by artels (see **ARTEL**). There is steam navigation during the summer between Novgorod and Staraia Russia.

IL'MENITE (so called from the *Ilmen* mountains in the southern Urals), or **MENACONITE**. A mineral with the composition $(\text{FeTi})_2\text{O}_4$, crystallizing in the hexagonal system, possessing a semimetallic lustre and a color ranging from brown to iron black. It occurs in scattered grains and crystals as an abundant constituent of certain igneous rocks, including basalt, diabase, and gabbro, and of magnetic iron ore. The proportion of titanium, which varies within wide limits, gives rise to a number of varieties of ilmenite, such as *kibdelophane*, *crochtonite*, *hystatite*, *mohsinite*, etc. When mixed with magnetite (titaniferous iron ore) in any considerable amount, it has been considered detrimental to the latter for smelting purposes. Ilmenite is found at various localities in Russia, Norway, France, in the Adirondacks of New York, in Connecticut, Massachusetts, and in Canada.

ILME'NIUM (Neo-Lat., from the *Ilmen* mountains in the southern Urals). A name given to a mixture of columbium and tantalum, which was at one time mistaken for an element.

IL NOTAJÓ DA LENTINO. See **LENTINO**, JACOPO DA.

IL OBEID. See **EL OBEID**.

ILOCANO, il-ò-ka'nò. The people known as Ilocano make up one of the most important of the civilized tribes of the Philippines. They form practically all the Christianized popula-

tion of Ilocos Norte, Ilocos Sur, and Union provinces, and have migrated in large numbers to other parts of Luzon. They seem to be of the same stock as the pagan tribe known as Tinguan, whom they resemble in personal appearance and language. After the arrival of the Spaniards the Ilocano were converted to Christianity and soon adopted many of the customs and utensils of the newcomers, but they still retain many traces of the old culture. The census of 1903 puts the total number at 803,942. See **PHILIPPINE ISLANDS**.

ILOCOS NORTE, è-lò'kòs nòr'tà. A Philippine province occupying the northwest corner of the island of Luzon (Map Philippine Islands, C 1). It is bounded on the west and north by the China Sea, on the east by the provinces of Cagayan and Abra, and on the south by the latter and Ilocos Sur. Area, 1265 square miles. It is traversed from north to south by a chain of mountains rising to a height of 4828 feet and covered with forests of pine and hardwoods. As the province is exposed in winter to the north winds, its climate is more tempered and more agreeable to foreigners than that of other parts of the island. The province is well watered, the principal river being the Laoag, and the valleys are very fertile, producing, besides the grains and fruits of the temperate zone, a fine quality of rice, good cotton and tobacco, chocolate, and sugar. Fruits include the pineapple, orange, and lemon. Iron ore is abundant. Cattle and horses are a great source of wealth, and the *carabao*, a species of ox or buffalo peculiar to the Philippines, is very numerous. The fisheries on the coast are also lucrative, a textile known as "blankets of Ilocos" is produced, and, on the whole, the province is one of the best developed on the island. A highroad leads through the province from Manila, and a railroad is projected from that city to Laoag (qv). Ilocos Norte was united with Ilocos Sur previous to 1818, when they were separated on account of their growing importance and population. Capital, Laoag. Pop., 1903, 178,995, chiefly Ilocano and Igorot. The census of 1903 classifies this total as 176,785 civilized and 2210 "wild."

ILOCOS SUR, sòor. A Philippine province, situated in the northwestern part of the island of Luzon (Map Philippine Islands, C 2). It is bounded on the north by Ilocos Norte, on the east by Abra and Lepanto, on the south by La Unión, and on the west by the China Sea. It is a narrow strip of rather low and flat coast land, with an area of 491 square miles. It is partly bounded by the river Amburayan and crossed by the Agra and a number of smaller streams, in the east are the mountains, culminating in Nagupu (4154 feet), the soil is very fertile, producing corn, peanuts, chocolate, indigo, sugar, and coconuts, all of which are exported. In the mountains are copper and timber, while there are also manufactures of furniture and carriages, baskets and hats, and the weaving of cotton textiles by the women in their homes is practiced all over the province. The towns are connected by good roads, though most of the rivers have to be forded, as there are few bridges. The highroad and projected railroad from Manila to Laoag passes through the province. Pop., 1903, 187,411, of which 173,800 are classed as civilized and 13,611 as "wild." Capital, Vigan (qv). See **ILOCOS NORTE**.

ILOILO, è'lò-è'lo. A province comprising the

southern half of the island of Panay in the Philippines and 56 outlying islands, one of which, Guimaras, has an area of 228 square miles and a population (1903) of 21,306 (Map Philippine Islands, D 5) The area of the province is 1776 square miles Pop, 1903, 410,315, of which 6383 are classed as "wild." The Panay part of the province has a coast line of 140 miles, with numerous safe harbors and anchoring grounds, among which those of Iloilo and Concepción are the best The province is separated from those of Capiz and Antique on the north by a chain of rugged mountains It is covered with forests of pine and dyewood, from which numerous rivers and torrents flow to the sea, often bringing destructive floods The climate, tempered by the constant monsoons, is much more moderate and far more healthful than that of Manila The level lands, which constitute the greater part of the area of the province, produce sugar, tobacco, corn, rice, coffee, cotton, and hemp The chief manufacturing industry is that of textiles, such as homespun fabrics of sinamay, piña, jusi, also the refining of sugar Commercial communication between the cities is easy and regular, the roads being generally in good condition The inhabitants consist almost entirely of Visayas, with some European and Chinese *Mestizos*, or half breeds, in the cities, and a few Negritos in the mountains The Visayas were first converted to Christianity by the Augustine fathers in the middle of the sixteenth century The province suffered for a long time from the piratical Moros, and forts were built here by the Spaniards as early as 1581 In 1616 an unsuccessful attempt was made by the Dutch to capture Panay At the end of the Spanish-American War in 1898 the natives were in complete possession of the island and showed determined resistance to American authority The capital, Iloilo (qv), is the second port of the Philippines

ILOILO The capital of the Province of Iloilo (qv), situated on the low sandy shore of the southeastern side of the island of Panay, on a strait separating Guimaras Island from the mainland (Map Philippine Islands, D 5) It has a seminary, a good government house, a church, an excellent harbor, is fortified and, next to Manila, is the chief commercial centre of the Philippines It makes jusi, lime, vinegar, piña, machinery, hats, and vehicles Its chief exports are sugar, tobacco, rice, coffee, and dyewoods, and it supports several industrial establishments, among which are a machine shop and a foundry Pop, 1903, 19,054 In February, 1899, it was partly burned by the Filipinos when bombarded by United States troops

ILONGOS, è-lôn'gôs A town of the Philippine Islands See HILONGOS

ILONGOT, è-lôn'gôt, or IBALAO, è'bá-lou'. The Ilongot live on the headwaters of the Cagayan River in northern Luzon They are primitive Malays, yet many of the tribe show a deep strain of Negrito blood Their costume is simple and much abbreviated The dress of the man consists of a bark clout and a girdle, while that of the woman is a short, one-piece bark skirt Society is on a very simple plane When a good hunter is mated to an industrious wife there is a commodious dwelling and an ample supply of food A man who has taken many heads or who is reputed to possess magical power may be held in high esteem Even in these instances a man is not lifted above his fellows in

daily life or in matters of government Government is, in fact, according to custom True village life is wholly absent, the dwellings being scattered along the mountain sides close to the clearings, in which the people raise rice, corn, millet, and sweet potatoes To these products are added the game and fish which they are able to procure with their primitive traps and weapons The tribe is to-day the wildest and least known in northern Luzon The census of 1903 puts the total number of persons in the tribe at 3016 See PHILIPPINE ISLANDS

ILOPANGO, è'lô-pan'gô A lake in the Central American Republic of Salvador, situated in a fertile and beautiful plain surrounded by high hills, a short distance east of the capital (Map Central America, C 4) Its water is saline and sulphurous and unfit to drink, though it abounds in fish It is 10 miles long by 6 broad and contains a number of islets, of which one was raised to about 400 feet by an eruption in 1879-80 and remains in the form of a volcanic cone

ILORIN, è-lô'ren, or **ALORI**, è-lô're The capital of a British province of northern Nigeria, West Africa, on the Asa, a tributary of the Niger, 170 miles northeast of Lagos (Map Africa, E 4) Like Abeokuta (qv), it was a municipal confederation of the Kingdom of Yoruba, established for mutual protection The town is surrounded by a mud wall, 12 miles in circumference, and has several mosques, Mohammedans predominating among the heterogeneous population of natives It has an extensive caravan trade with Central Africa and numerous local industries, including woven fabrics, arms, wood carving, pottery, and leather Pop (est), 1911, 60,000 to 80,000.

ILOW, è'lô, CHRISTIAN, BARON (c 1585-1634). An Imperial general in the Thirty Years' War, born at Neumark He entered the ranks at the beginning of the war and rapidly rose to the command of a regiment After fighting bravely under Tilly at Stadtlohn (1623), he was transferred to Wallenstein's army He easily won the confidence of his general and took part in the intrigues which resulted in the break between Wallenstein and the Emperor He was assassinated at the banquet of Eger

ILSE, è'lze, PRINCESS In German legend, the daughter of the giant of the Ilsenstein, who threw herself into the flood when parted from her lover and was changed into a water spirit

ILUS (Lat, from Gk 'Ilos) In Greek mythology, the reputed founder of Troy He was born in Dardania on Mount Ida and was the son of Tros, great-grandson of Dardanus, and father of Laomedon In an athletic contest in Phrygia he received, as the prize of victory, 50 youths and 50 maidens In addition, at the command of the oracle, a spotted cow was given to him, and he was directed to follow her until she should lie down and on that spot to establish a city This spot was the hill of the Phrygian Ate, where he founded the town which from his name was called Ilios, or Ilion, and from the name of his father, Troy The Palladium (qv) came to him there as a sign from Zeus

IL'VA See ELBA

ILYA MUROMETS, è-lyà' mûrô-mëts (Russ, Eljah of Murom) The favorite hero of the Russian *bylina* (qv), a representative of the peasant class The strongest of the "younger paladins," he spent his life in guarding his country against her enemies and in protecting wid-

ows and orphans. In extreme cases only did he shed blood. Usually the foe was frightened away by the exhibition of Ilya's strength in turning some mighty oak into splinters or some similar display of prowess. Consult Isabel Hapgood, *Epic Songs of Russia* (New York, 1885).

IMAGE. A term used in psychology, (1) for an elementary mental process having the same general attributes as sensation, and (2) for a primary complex of such imaginal processes. In the former sense images are the characteristic elements of ideas, as sensations are the characteristic elements of perception.

It is a moot question whether the elementary image is psychologically distinguishable from sensation, and even whether, as centrally initiated, it is psychophysically distinguishable from sensation as peripherally initiated, for peripheral stimulation seems to play a part in the arousal of many processes that are commonly termed images. Starting out from sensation, e.g., we have first the afterimage (See AFTER-IMAGES). Next comes the memory-afterimage, a sort of instantaneous photograph of the original sensation, resembling the positive afterimage in quality, but differing from it in dependence upon intention, brief stimulation, and precedent clearness of sensation. Then follow the images of synesthesia (q.v.) and of hallucination (q.v.), both of them definitely sensory in character. Certain visually minded persons have, further, "mental images" of such substantial nature that they can excite afterimages, thus, an imagined blue may be followed by an afterimage of yellow. In minds of this constitution, again, habitual memories are likely to be carried by stable and vivid images of a "typical" or "generic" sort. So far there is no observable difference between image and sensation. We are on more doubtful ground when we pass to the "faded" images by which, e.g., we fill out the missing lines in a drawing, or interpret a few blotches of color as a human figure in a certain position, and when we come to the memory-image proper. It is often said that the quality of the memory-image is relatively pale, misty, washed out, and that its duration and intensity are less than those of the corresponding sensation. But these are differences only of degree, sensations themselves may be pale, weak, and short-lived. There may perhaps be a textural difference between the memory-image proper and the sensation, but this question, as was said above, is still unsettled.

If we consider as images those processes of a sensory kind which appear without any obvious intervention of an external stimulus, we may say that visual and auditory images are common. Taste and smell images, though of undoubted occurrence, play but a small part in human consciousness. Kinesthetic images are difficult to discriminate from weak kinesthetic sensations due to actual movement or muscular contraction. Other organic images are rare.

IMAGE WORSHIP. The use, in public or private religious services, of graven or painted representations of sacred persons or things, and

especially the exhibition of honor, reverence, or worship to such representations. The most primitive religions needed no images, for the gods were the visible heavenly bodies or objects of nature. When the gods became more abstract, the sense of their reality was helped by the formation of images (See IDOL). The early Hebrews used images. David kept teraphim in his house, and the two shrines at Bethel and Dan had images of Jehovah in the form of a bull (1 Kings xii 26 ff.). The work of the prophets resulted in severe condemnation and, in the exile and later, in sarcasm and scorn of image worship (Isa. xl 10-17, Bel and the Dragon). Before the beginning of the Christian era image worship had completely disappeared from Hebrew usage. In Christianity images, not for worship but as aids to devotion, came into use before 200 A.D. Tertullian at the beginning of the third century mentions the image of the Good Shepherd as engraved upon chalices quite as if this were and had been for a long time a common practice. Crucifixes seem to have been introduced very early, this is proved by a graffito, often supposed to be a pagan caricature of Christianity, probably of the end of the second century, scratched upon the wall of a room in the palace of the Caesars (See GRAFFITO). It is a rude representation of a man standing in the attitude of prayer, with outstretched hands, before a grotesque caricature of the crucifixion, bearing the legend "Alexamenus worships God." The tombs of the Christians in the Roman catacombs, many of which are of a date anterior to Constantine, frequently have graven representations of the dove, of the cross, of the symbolical fish, of the ship, of Adam and Eve, of Moses striking the rock, of Jonah, of Daniel in the lions' den, of the Apostles Peter and Paul, and, above all, of the Good Shepherd. The chapels of the catacombs are profusely decorated with sacred representations, the age of which it is not easy to determine with accuracy, though some of them seem to come at least from the second century. After the condemnation of the Nestorian heresy in 430, statues and pictures of Christ, of the Virgin Mary, and the saints were very commonly used in public and private religious services and in churches and religious edifices. As the mass of the people became more ignorant in the sixth and seventh centuries, certain abuses with regard to the veneration of images in religious worship crept in. These led to a reaction against image worship in the East, which culminated in the movement known as iconoclasm (q.v.), because it commanded the breaking of images. The formal beginning of iconoclasm was an edict by the Emperor Leo III (717-741), known in history as the Isaurian. The exact terms, as well as the exact date, of the edict are unknown, though Hefele places it in 726. It commanded the destruction of all pious images in public places. The removal of a famous image of Christ over the palace door caused a popular uprising in Constantinople. In Greece and Lower Italy the opposition to the edict was pronounced. The Patriarch of Constantinople refused to allow it to be put into force, and Pope Gregory II (715-731) condemned it. Leo persisted, however, apparently influenced by the Caliph Yazid II, who set the example of destroying images in accordance with the Mohammedan religion. St. John of Damascus (died about 760), who lived under the Caliph, wrote three discourses

in defense of the use of images for religious purposes Under Leo's successor, Constantine Copronymus, a council confirmed the Imperial edict Leo IV also upheld iconoclasm Under his widow, Irene, however, the second Council of Nicaea (787) reaffirmed the orthodox views as to image worship, but succeeding emperors, except Michael the Stammerer (820-829), who tried to effect a compromise, were iconoclasts On Feb 19, 842, Theodora, widow of Theophilus (829-842), brought back the images in triumph to the cathedral of Constantinople This date is kept as the feast of orthodoxy By an error the acts of the Nicene Council were sent in a garbled translation to Charlemagne He objected to their publication in his realm in the *Libri Carolini*, now generally considered authentic, sent to Pope Hadrian I (772-795) about 793 The Nicene Council solemnly declared that the worship to be paid to images is not true adoration, *latreia*, which is to be given to God alone, but *douleia*, or veneration While the Greek verb προσκυνεῖν, 'to worship,' is used, it is explained that it is only in the sense of honoring because they represent God or His saints, and because the honor which is given to images is referred to their prototypes When the error of translation was explained, the misunderstanding ceased to exist The Council of Trent reaffirmed the declarations and distinctions of the second Nicene Council as to image worship, adding that there is "no virtue in images themselves on account of which they are to be worshiped, that no petition can be addressed to them, and that no trust is to be placed in them" The council advocates the true use of images, however, contending that they are of great advantage especially for the rude and unlearned, for whom they serve as memorials of the sufferings and of the mercy of Christ, as instructive records of the virtues of the saints and exhortations to the imitation of their example, and as incentives to the love of God and to the practice of piety In

certain parts of the world there are in Roman Catholic churches images for which there is a special veneration Sometimes the traditions, if not the images, can be traced back to pagan times The belief of the common people in such an image is the foundation of Selma Lagerlof's story, *The Antichrist*, but the Church has never officially taught that such images have power in themselves In the Eastern churches, especially the Russian, great reverence is paid to printed pictures of the saints, or representations in relief, called icons Every house has one or more, and in the churches the iconostasis, or screen which separates the sanctuary from the body of the church, is covered with them Statues, except of the angels, are not used

The Reformers rejected the use of images as an unscriptural novelty and stigmatized the Catholic practice as superstitious or even idolatrous The Zwinglian and subsequently the Calvinistic churches absolutely and entirely repudiated all use of images for the purpose of worship Luther, on the contrary, while he condemned the Roman worship of images, regarded the simple use of them, even in the church for the purpose of instruction and as incentive to faith and devotion, as one of those indifferent things which may be permitted, although not of necessary institution In the Lutheran churches of Germany and the northern kingdoms, pictures, crucifixes, and religious emblems are still freely retained In all wholly Protestant communions images are entirely unknown, although their use has been revived in the High Church portion of the Anglican communion of late years Consult Hefele, *Conciliengeschichte* (7 vols, Freiburg, 1854-71), Ludtke, *Die Bilderverehrung und bildlichen Darstellungen in den ersten christlichen Jahrhunderten* (ib, 1874), Kraus, *Roma sotterranea* (ib, 1879), E B Tylor, *Primitive Culture* (4th ed, 2 vols, London, 1903), L R Farnell, *Evolution of Religion* (ib, 1905).
